## ABSTRAK

Penelitian ini bertujuan untuk mengetahui pengaruh faktor produksi utama terhadap produksi, mengetahui efisiensi produksi dan mengetahui pengaruh faktor produksi penunjang terhadap efisiensi produksi perkebunan kelapa sawit rakyat. Lokasi penelitian ditetapkan secara purposif, metode penentuan sampel adalah *multistage sampling* dengan 450 sampel. Analisis data menggunakan uji regresi non linier berganda, *data envelopment analysis* dan uji regresi *censored Tobit*. Hasil penelitian yang diperoleh memperlihatkan bahwa faktor produksi utama secara simultan berpengaruh nyata terhadap produksi, dengan nilai koefisien determinasi ( $R^2$ ) sebesar 0,9760 dan nilai *rate technical substitution* (RTS) sebesar 0,9640. Pengaruh faktor produksi utama secara parsial terhadap produksi perkebunan kelapa sawit rakyat memperlihatkan bahwa lahan memiliki pengaruh positif yang nyata, tenaga kerja dan pupuk memiliki pengaruh yang tidak nyata sementara pestisida memiliki pengaruh negatif yang nyata. Sebahagian besar perkebunan kelapa sawit rakyat belum efisien secara teknis, ekonomi dan alokatif dengan nilai rata-rata 0,8741 ; 0,7544 dan 0,8610. Faktor produksi penunjang yang berpengaruh nyata terhadap efisiensi teknis adalah jenis kelamin, umur, organisasi petani, penggunaan sarana informasi dan teknologi, pengalaman bertani, ukuran keluarga, kategori bibit dan jarak ke pasar input. Faktor produksi penunjang yang berpengaruh nyata terhadap efisiensi ekonomi adalah jenis kelamin, umur, pendidikan, organisasi petani, penggunaan sarana informasi dan teknologi, pengalaman bertani, ukuran keluarga dan kategori bibit. Faktor produksi penunjang yang berpengaruh nyata terhadap efisiensi alokatif adalah jenis kelamin, umur, pendidikan, jarak ke pasar input, organisasi petani, pengalaman bertani, ukuran keluarga, kategori bibit, jumlah tanaman, aplikasi pupuk organik dan penggunaan sarana informasi dan teknologi.

**Kata kunci :** *data envelopment analysis, efisiensi produksi, perkebunan kelapa sawit rakyat, regresi non linier berganda, regresi censored Tobit*

## ABSTRACT

This study aims to determine the influence of primary production factors on production, production efficiency, and the influence of supporting production factors on production efficiency in smallholder oil palm plantations. The study location was purposively selected, and the sampling method was multistage, with 450 samples. Data analysis used multiple nonlinear regression, data envelopment analysis, and censored Tobit regression. The results showed that primary production factors simultaneously had a significant effect on production, with a coefficient of determination ( $R^2$ ) of 0.9760 and a rate of technical substitution (RTS) of 0.9640. The partial influence of primary production factors on smallholder oil palm plantation production showed that land had a significant positive effect, labour and fertiliser had no significant effects, and pesticides had a significant adverse effect. Most smallholder oil palm plantations are technically, economically, and allocatively inefficient, with average values of 0.8741, 0.7544, and 0.8610, respectively. Supporting production factors that significantly influence technical efficiency include gender, age, farmer organisation, use of information and technology facilities, farming experience, family size, seed category, and distance to input markets. Supporting production factors that significantly influence economic efficiency include gender, age, education, farmer organisation, use of information and technology facilities, farming experience, family size, and seed category. Supporting production factors that significantly influence allocative efficiency include gender, age, education, distance to input markets, farmer organisation, farming experience, family size, seed category, number of plants, organic fertiliser application, and use of information and technology facilities.

## RINGKASAN

KAJIAN EFISIENSI PRODUKSI PERKEBUNAN KELAPA SAWIT RAKYAT DI PROVINSI SUMATERA UTARA, oleh Jones Tonggor Simatupang NPM. 221901008 yang dibimbing oleh Promotor Muhammad Akbar Siregar dan Muhammad Buhari Sibuea.

Penelitian ini bertujuan untuk mengetahui pengaruh faktor produksi utama terhadap produksi, untuk mengetahui efisiensi produksi dan untuk mengetahui pengaruh faktor produksi penunjang terhadap efisiensi produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara. Daerah penelitian ditetapkan secara purposif, metode penentuan sampel dilakukan secara *multistage sampling* sehingga terpilih 450 sampel petani perkebunan kelapa sawit rakyat yang berasal dari tiga kabupaten (masing masing kabupaten diwakili satu kecamatan,, masing masing kecamatan diwakili dua desa) penghasil utama kelapa sawit rakyat di Provinsi Sumatera Utara yang mewakili kawasan Pantai Timur, Dataran Tinggi dan Pantai Barat Provinsi Sumatera utara. Metode analisis data yang digunakan adalah uji regresi non linier berganda, *data envelopment analysis* dan uji regresi *Censored Tobit*.

Hasil penelitian yang diperoleh adalah bahwa faktor produksi utama (lahan, tenaga kerja, pupuk dan pestisida) secara simultan berpengaruh nyata terhadap produksi perkebunan kelapa sawit rakyat dengan nilai koefisien determinasi ( $R^2$ ) sebesar 0,9760 dan nilai *rate tehcnical substitution* (RTS) sebesar 0,9640. Faktor produksi utama lahan secara parsial berpengaruh positif yang nyata terhadap produksi, tenaga kerja dan pupuk berpengaruh tidak nyata terhadap produksi, sementara pestisida berpengaruh negatif yang nyata terhadap produksi perkebunan kelapa sawit rakyat. Sebahagian besar perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara belum efisien secara teknis, ekonomi dan alokatif dimana hanya 10,22 % yang efisien secara teknis; 1,11 % yang efisien secara ekonomi dan 1,11 % yang efisien secara alokatif. Nilai efisiensi teknis rata-rata adalah 0,8741; nilai efisiensi ekonomi rata-rata adalah 0,7544; dan nilai efisiensi alokatif rata-rata adalah 0,8610. Faktor produksi penunjang yang berpengaruh nyata terhadap efisiensi teknis perkebunan kelapa sawit rakyat adalah jenis kelamin, umur, pengalaman keikutsertaan dalam organisasi petani, pengalaman penggunaan sarana informasi dan teknologi, pengalaman bertani, ukuran keluarga, kategori bibit dan jarak tempat tinggal petani ke pasar input. Faktor produksi penunjang yang berpengaruh nyata terhadap efisiensi ekonomi adalah jenis kelamin, umur, pendidikan, pengalaman keikutsertaan dalam organisasi petani, pengalaman penggunaan sarana informasi dan teknologi, pengalaman bertani, ukuran keluarga dan kategori bibit. Faktor produksi penunjang yang berpengaruh nyata terhadap efisiensi alokatif adalah jenis kelamin, umur, pendidikan, jarak tempat tinggal petani ke pasar input, pengalaman keikutsertaan dalam organisasi petani, pengalaman bertani, ukuran keluarga, kategori bibit, jumlah tanaman, pengalaman mengaplikasikan pupuk organik dan pengalaman penggunaan sarana informasi dan teknologi.

*Kata kunci : data envelopment analysis, efisiensi produksi, perkebunan kelapa sawit rakyat, regresi non linier berganda , regresi censored Tobit*

## SUMMARY

A STUDY OF PRODUCTION EFFICIENCY OF SMALLHOLDERS' OIL PALM PLANTATIONS IN NORTH SUMATERA PROVINCE, by Jones Tonggor Simatupang, NPM. 221901008, supervised by Promoters Muhammad Akbar Siregar and Muhammad Buhari Sibuea.

This study aims to determine the influence of primary production factors on production, production efficiency, and the influence of supporting production factors on production efficiency of smallholder oil palm plantations in North Sumatra Province. The study area was determined purposively, and the sampling method used was multistage sampling, resulting in the selection of 450 smallholder oil palm farmers from three regencies (each regency represented by one sub-district, and each sub-district represented by two villages) as the leading producers of smallholder oil palm in North Sumatra Province, representing the East Coast, Highlands, and West Coast regions of North Sumatra Province. The data analysis methods used were multiple nonlinear regression, data envelopment analysis, and censored Tobit regression.

The results of the study indicate that the main production factors (land, labour, fertiliser, and pesticides) simultaneously have a significant effect on the production of smallholder oil palm plantations, with a coefficient of determination ( $R^2$ ) of 0.9760 and a rate of technical substitution (RTS) of 0.9640. The main production factors of land partially have a significant positive effect on production, labour and fertiliser have no significant effect on production. In contrast, pesticides have a significant adverse effect on the production of smallholder oil palm plantations. Most smallholder oil palm plantations in North Sumatra Province are not yet technically, economically, or allocatively efficient, with only 10.22% technically efficient, 1.11% economically efficient, and 1.11% allocatively efficient. The average technical efficiency value is 0.8741; the average economic efficiency value is 0.7544; and the average allocative efficiency value is 0.8610. Supporting production factors that significantly influence the technical efficiency of smallholder oil palm plantations include gender, age, experience of participation in farmer organisations, experience of using information and technology facilities, farming experience, family size, seed category, and distance from the farmer's residence to input markets. Supporting production factors that significantly influence economic efficiency include gender, age, education, experience with farmer organisations, experience with information and technology facilities, farming experience, family size, and seed category. Supporting production factors that significantly influence allocative efficiency are gender, age, education, distance from the farmer's residence to input markets, experience of participation in farmer organisations, farming experience, family size, seed category, number of plants, experience of applying organic fertiliser and experience of using information and technology facilities.

## KATA PENGANTAR

Puji syukur yang tiada terhingga penulis haturkan ke hadirat Tuhan Yang Maha Kuasa yang telah memberikan kelimpahan berkat dan karuniaNya sehingga penulis dapat menyelesaikan penulisan disertasi yang berjudul “Kajian Efisiensi Produksi Perkebunan Kelapa Sawit Rakyat di Provinsi Sumatera Utara” ini.

Selama pekerjaan penyelesaian disertasi, penuklis telah banyak menerima bantuan, baik berupa dukungan moral dan material serta bimbingan dari berbagai pihak. Dengan demikian, pada kesempatan ini penulis mengucapkan terimakasih dan penghargaan setinggi-tingginya kepada:

1. Rektor Universitas Medan Area yaitu Bapak Prof. Dr. Ir. Dadan Ramdan, M.Eng, M.Sc.
2. Direktur Program Pascasarjana Universitas Medan Area yaitu Ibu Prof. Dr. Ir. Hj. Retna Astuti Kuswardani, M.S.
3. Ketua Program Studi Doktor Ilmu Pertanian Program Pascasarjana Universitas Medan Area yaitu Bapak Prof. Ir. Zulkifli Lubis, Ph.D. M.S.
4. Promotor yaitu Bapak Dr. Muhammad Akbar Siregar, S.E. M.Si dan Co-Promotor yaitu Bapak Prof.Dr.Ir. Mhd. Buhari Sibuea, M.Si.
5. Seluruh dosen pengajar pada Program Studi Doktor Ilmu Pertanian Program Pascasarjana Universitas Medan Area.
6. Seluruh pegawai administratif pada Program Studi Doktor Ilmu Pertanian Program Pascasarjana Universitas Medan Area.
7. Seluruh rekan-rekan mahasiswa pada Program Studi Doktor Ilmu Pertanian Program Pascasarjana Universitas Medan Area Angkatan Tahun 2022.
8. Rekan-rekan dosen sejawat pada Fakultas Pertanian Universitas Methodist Indonesia terutama Manaor B.P. Nababan, Lince R. Panataria, Pantas Simanjuntak dan Efbertias Sitorus.
9. Pemerintahan Kecamatan Bandar Pulau Kabupaten Asahan dan Pemerintahan Desa Gonting Malaha serta Pemerintahan Desa Padang Pulau Kecamatan Bandar Pulau Kabupaten Asahan.

10. Pemerintahan Kecamatan Tonduhan Kabupaten Simalungun dan Pemerintahan Desa Buntu Turunan serta Pemerintahan Desa Buntu Bayu Kecamatan Tonduhan Kabupaten Simalungun.
11. Pemerintahan Kecamatan Lubuk Barumon Kabupaten Padang Lawas dan Pemerintahan Desa Aek Lancat dan Pemerintahan Desa Pagaran Mompang Kecamatan Lubuk Barumon Kabupaten Padang Lawas.
12. Seluruh sampel penelitian yaitu petani perkebunan kelapa sawit rakyat di enam desa penelitian yaitu Desa Gonting Malaha dan Desa Padang Pulau Kecamatan Bandar Pulau Kabupaten Asahan, Desa Buntu Turunan dan Desa Buntu Bayu Kecamatan Tonduhan Kabupaten Simalungun serta Desa Aek Lancat dan Desa Pagaran Mompang Kecamatan Lubuk Barumon Kabupaten Padang Lawas.

Ucapan terimakasih dan penghargaan secara khusus penulis sampaikan kepada isteri penulis Erika Madonna Sitompul atas doa, perhatian dan dukungan tidak terhingga dan tiada pernah berhenti selama penulis mengikuti perkuliahan serta penyelesaian disertasi ini. Hal yang sama penulis sampaikan kepada anak/menantu Andre M. Simatupang, S.Kom/Herdika Nababan, A.Md., Alfredo P. Simatupang, S.E. M.Si., Aditia E.C. Simatupang, S.P. M.P., dan Anastassia R.G. Simatupang.

Penulis berharap kiranya disertasi ini dapat memberi manfaat bagi pemerintah dan seluruh pemangku kepentingan demi pengembangan perkebunan kelapa sawit rakyat terutama di Provinsi Sumatera Utara. Akhir kata, penulis mengucapkan terimakasih kiranya Tuhan memberkati kita semua.

Medan, Maret 2026

Penulis

**JONES TONGGOR SIMATUPANG**

## RIWAYAT HIDUP

Penulis lahir di Pakkat Pangaloan Kecamatan Pahae Jae Kabupaten Tapanuli Utara 1 Juli 1966, anak pertama dari tiga bersaudara putra dari Bapak Gr. Bistok Simatupang (+) dan Ibu Loisken Nainggolan (+). Profesi penulis adalah dosen Pegawai Negeri Sipil Lembaga Layanan Pendidikan Tinggi Wilayah I dpk Fakultas Pertanian Universitas Methodist Indonesia Medan. Menikah dengan Erika Madonna Sitompul yang dikaruniai empat orang anak yaitu Andre M. Simatupang, S.Kom., Alfredo P. Simatupang, S.E., M.Si., Aditia E. C. Simatupang, S.P., M.P. dan Anastassia R.G. Simatupang.

Riwayat pendidikan penulis adalah sebagai berikut:

1. Sekolah Dasar Negeri 2 Pangaloan Kecamatan Pahae Jae, tamat Tahun 1977.
2. Sekolah Menengah Pertama Negeri Sarulla Kecamatan Pahae Jae, tamat Tahun 1981.
3. Sekolah Menengah Atas Negeri Tarutung, tamat Tahun 1984.
4. Jurusan Sosial Ekonomi Pertanian Fakultas Pertanian Universitas Sumatera Utara Medan, tamat Tahun 1989.
5. Jurusan Perencanaan Pembangunan Wilayah dan Pedesaan Program Pasca Sarjana Universitas Sumatera Utara Medan melalui Program BPSS, tamat Tahun 2001.
6. Program Studi Doktor Ilmu Pertanian Program Pasca Sarjana Universitas Medan Area Medan, sejak Tahun 2022.

Selama kuliah Strata-1, penulis adalah penerima Beasiswa Tunjangan Ikatan Dinas Departemen Pendidikan dan Kebudayaan Republik Indonesia, sehingga setelah tamat Strata-1 diangkat menjadi dosen Pegawai Negeri Sipil Lembaga Layanan Pendidikan Tinggi Wilayah I (dahulu Kopertis Wilayah I) TMT 1 Maret 1990. Riwayat pekerjaan selama berprofesi sebagai dosen adalah sebagai berikut:

1. Sekretaris Jurusan Sosial Ekonomi Pertanian Fakultas Pertanian UMI Medan Periode Tahun 1996 – 1999.
2. Pembantu Dekan 3 Fakultas Pertanian UMI Medan Periode Tahun 1999 – 2003.
3. Ketua Lembaga Pengabdian Pada Masyarakat Universitas Methodist Indonesia Medan Periode Tahun 2003 – 2007.

4. Ketua Jurusan Sosial Ekonomi Pertanian Fakultas Pertanian UMI Medan Periode Tahun 2007 – 2010.
5. Dekan Fakultas Pertanian UMI Medan Periode 2010 – 2011.
6. Wakil Rektor I Universitas Methodist Indonesia Medan Periode Tahun 2011 – 2015 dan Periode 2015 -2020.
7. Dekan Fakultas Pertanian UMI Medan Periode Tahun 2020 – 2024.
8. Ketua Program Studi Agribisnis Fakultas Pertanian UMI Medan Periode 2025 – 2029.

Penulis aktif dalam organisasi sosial kemasyarakatan. Beberapa jabatan yang pernah diemban penulis adalah:

1. Kemajelis Gereja Methodist Indonesia Manna Marturia Tanjung Sari Medan dari Sekretaris Majelis, Komisi Penghubung, Bendahara Pembangunan dan Panitia Kebaktian. Hingga saat ini penulis bertugas sebagai Ketua Komisi Penatalayan Keuangan dan Pengkotbah Awam (Lay Speaker).
2. Persekutuan Pria Methodist Indonesia sebagai ketua tingkat lokal, wakil ketua tingkat distrik dan Sekretaris Jenderal tingkat nasional pada Tahun 2007 – 2011.
3. Pengurus Persatuan Marga Lumban Gambiri Sianturi tingkat kota Medan, Simatera Utara dan Indonesia hingga saat ini.
4. Pengurus Persatuan Marga Sitompul Sektor 45 Sari Rejo (Tanjung Sari dan Tanjung Rejo Setiabudi Kota Medan dan sekitarnya hingga saat ini.

I. PENDAHULUAN

1.1 Latar Belakang

Pengusahaan kelapa sawit Indonesia terus meningkat setiap tahunnya. Selain perkebunan besar milik negara dan swasta, perkebunan rakyat merupakan salah satu status pengusahaan kelapa sawit di Indonesia. Tabel 1 menunjukkan bagaimana perkembangan areal dan produksi minyak kelapa sawit (*Crude Palm Oil*) di Indonesia te selama sepuluh tahun terakhir.

Tabel 1. Luas Areal dan Produksi Minyak Kelapa Sawit (CPO) Tahun 2015-2024

| Tahun | Luas Areal (Ha) |         |           |            | Produksi (Ton) |           |            |            |

\* = Estimasi

Tabel 1 menunjukkan terdapatnya kecenderungan peningkatan areal dan produksi CPO di Indonesia dalam beberapa tahun terakhir. Selain itu, berdasarkan status pengusahaan tahun 2023, perkebunan kelapa sawit besar swasta di Indonesia memiliki luas terbesar sebesar 55,71%, diikuti oleh perkebunan kelapa sawit rakyat sebesar 40,76%, dan perkebunan kelapa sawit besar negara sebesar 3,53%.

Luas areal perkebunan kelapa sawit rakyat diperkirakan akan terus meningkat dan akan menjadi bahagian terbesar perkebunan kelapa sawit hingga mencapai angka 60%. Dengan demikian peranan perkebunan rakyat memiliki kontribusi yang signifikan dalam pembangunan perkebunan kelapa sawit di Indonesia. Meskipun diperkirakan perkebunan

rakyat akan menjadi bahagian terbesar perkebunan kelapa sawit, produktivitas perkebunan kelapa sawit rakyat tersebut saat ini masih rendah yaitu hanya 2,59 ton per hektar pada Tahun 2023, yang jauh lebih kecil dibanding produktivitas rata-rata nasional sebesar 3,04 ton per hektar, produktivitas perkebunan besar swasta dengan produktivitas sebesar 3,31 ton per hektar, dan produktivitas perkebunan besar negara sebesar 4,09 ton per hektar (Direktorat Jenderal Perkebunan, 2024).

Terdapat 26 provinsi di Indonesia sebagai areal pertanaman kelapa sawit sesuai data yang dikeluarkan oleh Direktorat Jenderal Perkebunan (2024). Tabel 2 menunjukkan luas areal dan produksi sepuluh provinsi yang dikenal sebagai sentra produsen kelapa sawit di Indonesia.

Tabel 2. Luas Areal dan Produksi Kelapa Sawit Pada Sepuluh Sentra Provinsi Produsen Sawit di Indonesia Tahun 2023

PBN = Perkebunan Besar Negara  
PBS = Perkebunan Besar Swasta

Berdasarkan data pada Tabel 2, Provinsi Sumatera Utara adalah provinsi ketiga terbesar dalam produksi kelapa sawit dan kelima terbesar provinsi produsen kelapa sawit rakyat di Indonesia. Hal tersebut disebabkan oleh tersedianya lahan yang cukup luas untuk budidaya kelapa sawit rakyat yang tersebar di beberapa kabupaten yang ada di Provinsi Sumatera Utara.. Pada Tahun 2023, areal perkebunan kelapa sawit di Provinsi Sumatera Utara terdiri dari 35,60 % perkebunan kelapa sawit rakyat, 21,98 % perkebunan

besar negara dan 42,42 % perkebunan besar swasta. Perkebunan kelapa sawit semakin lama semakin diminati masyarakat Sumatera Utara. Jika sebelumnya areal pertanamannya sawit hanya terdapat di Kawasan Pantai Timur dan Kawasan Pantai Barat, maka sekarang ini perkebunan sawit rakyat sudah terdapat di Kawasan Dataran Tinggi. Tabel 3 menunjukkan luas areal perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara pada Tahun 2022.

Sumber: Direktorat Jenderal Perkebunan, (2024)

Keterangan TBM = Tanaman Belum Menghasilkan

TM = Tanaman Menghasilkan

TTM/TR = Tanaman Tua Menghasilkan/Tanaman Rusak

Tabel 3 menunjukkan bahwa bahwa areal perkebunan kelapa sawit rakyat tersebar di 22 kabupaten/kota dari 33 kabupaten/kota yang ada di Provinsi Sumatera Utara. Sepuluh besar kabupaten/kota sebagai wilayah perkebunan kelapa sawit rakyat berturut-turut dari urutan kesepuluh hingga urutan pertama adalah Kabupaten Deli Serdang, Kabupaten Mandailing Natal, Kabupaten Padang Lawas Utara, Kabupaten

Labuhan Batu, Kabupaten Padang Lawas, Kabupaten Simalungun, Kabupaten Labuhan Batu Selatan, Kabupaten Langkat, Kabupaten Labuhan Batu Utara dan Kabupaten Asahan.

Perkebunan rakyat adalah perkebunan yang dikelola atau dilaksanakan oleh individu atau petani pekebun yang digolongkan sebagai usaha kecil tanaman perkebunan rakyat. Menurut Undang-Undang Nomor 18 Tahun 2014 Tentang Perkebunan bahwa pekebun adalah warga negara Indonesia perorangan yang menjalankan kegiatan usaha perkebunan pada skala usaha yang kecil yang tidak mencapai skala tertentu. Khusus untuk petani pekebun yang dijelaskan pada ketentuan umum Undang Undang No.18 Tahun 2004, dikecualikan dari ketentuan perizinan atau tidak diharuskan mengurus atau memperoleh izin usaha perkebunan (KPPU RI, 2020).

Menurut Revlina (2023), ciri-ciri umum perkebunan rakyat di Indonesia adalah sebagai berikut:

- a. Luas areal lahan yang lebih kecil dari dari dua puluh lima hektar di tanah adat atau milik pribadi.
- b. Lokasi kegiatan perkebunan tersebar secara geografis pada wilayah pemukiman penduduk.
- c. Penggunaan teknologi konvensional dan sederhana.
- d. Berhadapan dengan masalah lemahnya permodalan, pemasaran, dan kualitas produksi yang dihasilkan.

Ciri-ciri perkebunan rakyat di atas menunjukkan bahwa hasil produksi dan pendapatan petani perkebunan rakyat sangat kecil dan berkualitas rendah.

Deforestasi di Indonesia sering dituding sebagai akibat dari kegiatan perkebunan kelapa sawit rakyat. Wicke et al. (2011) menunjukkan bahwa sebesar 27% (2.6 juta ha) dari 9,7 juta deforestasi yang terjadi antara tahun 1997 dan 2003 telah mengubah hutan menjadi lahan perkebunan kelapa sawit. Menurut Fitzherbert et.al. (2008) bahwa deforestasi yang diakibatkan alih fungsi (konversi) dari hutan menjadi lahan perkebunan kelapa sawit diperkirakan sebesar 16 %, dengan catatan jika semua lahan kelapa sawit yang ada berasal dari lahan hutan, namun pada kenyataannya tidak semua areal budidaya kelapa sawit berasal dari hutan (Gunarso et.al., 2013). Adalah merupakan suatu

kenyataan, bahwa kinerja perkebunan kelapa sawit rakyat yang biasanya ditetapkan berdasarkan produktivitas, yang masih berada jauh lebih kecil dibanding perkebunan besar milik swasta dan milik negara. Pada hal jika dilihat dari jumlah petani yang mengusahakan perkebunan rakyat sebesar 2,2 juta jiwa menunjukkan bahwa masa depan industri sawit di Indonesia juga akan ditentukan oleh perkebunan rakyat. Rendahnya produktivitas tanaman merupakan masalah krusial yang berlaku pada pengelolaan perkebunan kelapa sawit rakyat. Hal tersebut diduga karena jeleknya praktik pengelolaan perkebunan sebagai akibat dari tingkat pengetahuan dan kemampuan teknis usahatani yang rendah serta lemahnya kemampuan modal yang dimiliki oleh petani pekebun. Produktivitas tanaman kelapa sawit pada perkebunan besar swasta jauh lebih besar dibanding produktivitas tanaman kelapa sawit perkebunan kelapa sawit rakyat. Diperkirakan terdapat kesenjangan produktivitas yang relatif tinggi antara 41 – 64 % dari sekitar 7 – 20 ton TBS/ha/tahun produktivitas perkebunan kelapa sawit secara umum (Suharno et.al., 2015).

Mengingat besarnya kontribusi perkebunan rakyat terhadap perkebunan secara nasional sementara pengusaha perkebunan rakyat masih dihadapkan pada kondisi tingkat produktivitas tanaman yang masih jauh lebih rendah dibanding perkebunan besar negara dan perkebunan besar swasta, maka dalam upaya peningkatan produktivitas perkebunan secara nasional, menjadi hal yang sangat penting untuk meningkatkan produktivitas maupun efisiensi perkebunan rakyat. Upaya peningkatan efisiensi pada perkebunan rakyat akan berpengaruh besar terhadap meningkatnya efisiensi produksi perkebunan secara nasional (Setiyanto, 2015).

Proses produksi usahatani adalah merupakan suatu rangkaian proses yang cukup panjang serta beresiko tinggi. Proses produksi dengan waktu yang panjang tidak hanya berbeda menurut jenis komoditas yang diusahakan, tetapi juga berdasarkan kecukupan faktor produksi yang diperlukan untuk mencapai produksi. Sebagaimana dinyatakan oleh Sasongko (2010), bahwa kultivar tanaman yang ditanam, agroekologi atau lingkungan tempat tumbuh tanaman, dan pengelolaan yang dilakukan oleh petani atau pengusaha tani berkontribusi pada keberhasilan budidaya suatu jenis komoditas. Dalam proses produksi usahatani, faktor utama yang dibutuhkan adalah faktor produksi. Proses

produksi usahatani membutuhkan faktor produksi sebagai input. Dengan demikian, proses produksi pertanian adalah proses yang mengkoordinasikan faktor produksi pertanian untuk memperoleh hasil pertanian sebagai output (Arifin, 2015).

Daniel (2002) menyatakan bahwa proses produksi dapat dimulai hanya jika persyaratan dipenuhi, dan faktor produksi mengacu pada persyaratan tersebut. Menurut Shephard (2016), terdapat dua jenis faktor produksi yaitu factor produksi Utama dan factor produksi penunjang. Faktor produksi utama atau input, adalah yang digunakan secara langsung dalam proses produksi; dan faktor produksi penunjang adalah faktor produksi yang digunakan secara tidak langsung dalam proses produksi tetapi membantu meningkatkan efisiensi dan efektivitas proses produksi.

Hasil penelitian Ariyanto et.al., (2017) di Kampar Riau yang dilakukan pada perkebunan kelapa sawit rakyat pola swadaya memperlihatkan bahwa umur tanaman dan jumlah pupuk urea secara parsial berpengaruh positif terhadap produksi, sementara luas lahan, jumlah populasi tanaman kelapa sawit, pestisida, pupuk SP36 dan pupuk KCL tidak berpengaruh terhadap produksi. Penelitian yang dilakukan pada perkebunan kelapa sawit rakyat di Aceh Tamiang memperlihatkan bahwa faktor produksi yang berpengaruh positif terhadap produksi adalah penggunaan tenaga kerja, jenis bibit, penggunaan pupuk TSP, penggunaan herbisida dan jumlah pohon (Mustari et al., 2020). Penelitian yang dilakukan pada perkebunan kelapa sawit rakyat di Mukomuko memperlihatkan bahwa umur tanaman dan pencurahan tenaga kerja berpengaruh positif terhadap produksi, sementara luas lahan, jumlah populasi, pupuk, pestisida dan jenis lahan tidak berpengaruh terhadap produksi (Alfayanti and Efendi, 2013).

Penelitian yang dilakukan Ismiasih and Afroda (2023) pada perkebunan kelapa sawit rakyat di Riau menunjukkan bahwa variabel yang berpengaruh positif terhadap produksi adalah jumlah tanaman, umur tanaman, pupuk urea, pupuk SP36, pupuk NPK, pupuk organik, jumlah tenaga kerja serta anggota koperasi dan peserta kemitraan. Sementara itu, variabel lahan gambut, keanggotaan dalam kelompok tani dan kegiatan penyuluhan tidak berpengaruh terhadap produksi. Hasil penentuan Panjaitan et al., (2020) pada perkebunan kelapa sawit rakyat di Sungai Buluh Kecamatan Singingi Hilir menunjukkan bahwa faktor yang berpengaruh positif terhadap produksi adalah luas lahan

dan pupuk urea, sementara variabel tenaga kerja pupuk TSP, pupuk KCl dan pestisida tidak berpengaruh terhadap produksi.

Kinerja suatu usahatani tidak dapat dinilai hanya berdasarkan tingkat produksi tetapi juga harus dinilai dari tingkat produktivitas dan efisiensi produksi. Menurut Doll and Orazem (1984) dalam Setiyanto (2015) bahwa efisiensi adalah merupakan metode yang dilaksanakan dalam suatu proses produksi untuk menghasilkan produksi dengan jumlah yang sebesar-besarnya dengan pengeluaran terutama input atau bahan baku yang sekecil-kecilnya. Juga dapat diartikan bahwa efisiensi adalah upaya untuk menghasilkan produksi (ouput) sebesar mungkin dengan sumber daya yang terbatas.

Terdapat tiga jenis efisiensi yaitu efisiensi teknis (*technical efficiency*), efisiensi ekonomi (*economic efficiency*) dan efisiensi harga (*price efficiency* atau *allocative efficiency*). Efisiensi teknis adalah besaran yang menggambarkan perbandingan antara produksi yang terjadi (aktual) dan produksi maksimal (seharusnya). Kemampuan untuk menggunakan input secara optimal dan proporsional pada tingkat harga input dan ouput yang berlangsung disebut efisiensi harga. Untuk mencapai efisiensi ekonomi yang tinggi, produsen harus memiliki kemampuan untuk mengatur faktor produksi sedemikian rupa sehingga menghasilkan produksi yang tinggi. Efisiensi teknis (ET), efisiensi harga (EH), dan efisiensi ekonomi (EE) memiliki hubungan di mana efisiensi ekonomi (EE) adalah hasil kali antara ET dan EH ( $EE = ET \times EH$ ). Dengan memperhitungkan harga input dan harga ouput, maka untuk memperoleh keuntungan usahatani yang tinggi diperlukan pengalokasian input (faktor produksi) yang proporsional yang dapat dihitung dengan nilai EH.

Nguyen et al. (2018) mengatakan bahwa salah satu cara yang dapat dilakukan oleh pengusaha dalam upaya mengetahui tingkat penggunaan input atau kombinasi beberapa jenis input untuk menghasilkan output adalah dengan mengukur dan mengkaji efisiensi produksi usahatani. Hal tersebut juga berguna untuk mengetahui upaya-upaya yang dapat dilakukan untuk meningkatkan efisiensi usahatani yang dijalankan oleh pengusaha. Kenyataan yang terjadi bahwa perkebunan kelapa sawit rakyat di Indonesia termasuk Provinsi Sumatera Utara memiliki produktivitas yang masih rendah. Hal tersebut merupakan bukti masih terjadinya tidak efisien (inefisiensi) pada proses

produksi. Oleh karena itu, kajian tentang efisiensi produksi perkebunan kelapa sawit rakyat adalah sangat penting. Tujuan dari kajian tersebut adalah untuk meningkatkan kinerja penggunaan sumber daya dan mengurangi pemborosan sumber daya dalam pengelolaan perkebunan kelapa sawit rakyat. Pada gilirannya kajian efisiensi produksi yang dilakukan, akan dapat menghasilkan kinerja yang lebih baik pada perkebunan kelapa sawit untuk masa yang akan datang.

Penelitian pada perkebunan kelapa sawit rakyat di Sanggau Kalimantan Barat oleh Yahyawileonides (2022) dilakukan untuk menganalisis efisiensi teknis dengan menggunakan analisis Fungsi Produksi *Frontier*. Hasil penelitian yang dilakukan menunjukkan bahwa efisiensi teknis rata-rata adalah 0,8795 dengan nilai efisiensi teknis terendah sebesar 0,7569 dan tingkat efisiensi teknis tertinggi sebesar 0,9471. Syuhada et al. (2022) mengadakan penelitian efisiensi teknis dan faktor yang mempengaruhinya di perkebunan kelapa sawit rakyat di Pasaman Barat mencakup mitra swadaya dan koperasi. Fungsi Produksi *Stochastic Frontier Cobb Douglas* digunakan untuk melakukan penelitian ini. Hasil menunjukkan efisiensi teknis rata-rata 0,70. Status pengelolaan lahan berpengaruh positif terhadap efisiensi teknis sementara bibit berpengaruh negatif. Usia, pendidikan, pengalaman berusaha, dan luas lahan tidak berpengaruh terhadap efisiensi teknis kelapa sawit petani.

Petani kelapa sawit di Indonesia menghadapi inefisiensi teknis. Hasil penelitian Abdul et.al., (2022) dengan menggunakan Analisis *Stochastic Frontier* menunjukkan bahwa efisiensi teknis perkebunan kelapa sawit memiliki nilai rata-rata 0,6257. Hasil estimasi menunjukkan bahwa pendidikan, umur tanaman, sistem tanam, kualitas benih, penyuluhan, dan petani plasma merupakan faktor penting untuk perbaikan efisiensi teknis. Penelitian Varina et.al., (2020) telah dilakukan untuk mengevaluasi kinerja produksi dan efisiensi teknis produksi kelapa sawit di Indonesia berdasarkan pola pengelolaan (petani swadaya dan petani binaan) dengan analisis empiris menggunakan metode *Meta-Frontier*. Hasil penelitian yang diperoleh memperlihatkan bahwa nilai efisiensi teknis rata-rata adalah sebesar 0,6789 dan 0,7127 masing-masing untuk petani swadaya dan petani binaan. Dengan penggunaan pendekatan *Stochastic Frontier*, Alwarritzi et.al., (2015) melakukan penelitian pada perkebunan sawit rakyat di

Indonesia. Hasil penelitian memperlihatkan bahwa keanggotaan kelompok tani, kegiatan penyuluhan, pendidikan dan diversifikasi usahatani berpengaruh positif terhadap efisiensi teknis usahatani.

Menurut penelitian Welda et.al., (2020) pada usahatani kelapa sawit skala kecil di Dharmasraya Sumatera Barat yang menggunakan analisis Fungsi Produksi *Stochastic Frontier Cobb Douglas*, diketahui bahwa penggunaan tenaga kerja, penggunaan KCl, NPK, Dolomit, dan bibit berpengaruh positif pada produksi kelapa sawit. Sementara penggunaan urea, pupuk kandang, pestisida, dan kategori petani berpengaruh negatif terhadap produksi kelapa sawit. Tingkat efisiensi teknis yang diperoleh adalah 0,73. Penelitian efisiensi teknis perkebunan kelapa sawit rakyat di Kalimantan Barat dengan penggunaan Fungsi Produksi *Stochastic Frontier* memperlihatkan bahwa faktor yang berpengaruh positif terhadap efisiensi teknis adalah jumlah pohon produktif, umur tanaman, pupuk urea, pupuk SP36, pupuk NPK, tenaga kerja dan pestisida. Rata-rata nilai efisiensi teknis yang diperoleh adalah 0,83 (Ismiasih (2017)). Fariani et.al., (2019) telah melakukan penelitian tentang efisiensi teknis menggunakan metode *Stochastic Frontier* pada perkebunan kelapa sawit rakyat di Kecamatan Air Sugihan Kabupaten Ogan Komering Ilir Provinsi Sumatera Selatan. Hasil penelitian memperlihatkan bahwa rata-rata efisiensi teknis adalah sebesar 0,86090. Faktor yang berpengaruh positif terhadap efisiensi teknis adalah tingkat pendidikan petani.

Penelitian Ngaisset and Jia (2020) bertujuan untuk menganalisis efisiensi teknis perkebunan kelapa sawit rakyat di Lobaye Republik Afrika Tengah. Dengan menggunakan analisis Fungsi Produksi *Stochastic Frontier*, diperoleh hasil penelitian yang memperlihatkan bahwa efisiensi teknis rata-rata adalah 0,81. Dari hasil penelitian diketahui bahwa produktivitas perkebunan kelapa sawit rakyat dipengaruhi oleh pendidikan produsen di bidang produksi. Penelitian Bankole et.al., (2018) dilakukan untuk mengevaluasi efisiensi produksi perkebunan kelapa sawit rakyat di Negara Bagian Edo Nigeria dengan menggunakan metode *Stochastic Frontier*. Analisis efisiensi ekonomi petani perkebunan kelapa sawit rakyat mengungkapkan adanya biaya efek inefisiensi dalam produksi minyak sawit yang dibuktikan dengan nilai signifikansi gamma 1.000. Rata-rata efisiensi teknis, alokatif dan ekonomi yang diperoleh adalah

masing-masing 0,855 ; 0,883 dan 0,753. Jenis kelamin, tingkat pendidikan dan pengalaman berusahatani berpengaruh positif terhadap efisiensi teknis responden Efisiensi teknis petani perkebunan kelapa sawit rakyat adalah 0,65 sampai 0,95 dengan mayoritas responden (63,3%) memiliki efisiensi teknis di atas 0,94.

Dari uraian tentang penelitian efisiensi produksi perkebunan kelapa sawit rakyat di atas, maka dapat diuraikan beberapa hal sebagai berikut:

- a. Penelitian tentang efisiensi produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara belum pernah dilakukan atau tidak dapat ditelusuri.
- b. Keseluruhan penelitian tentang efisiensi produksi perkebunan kelapa sawit yang dapat ditelusuri menggunakan Analisis Stochastic Frontier dengan Fungsi Produksi Cobb-Douglas.
- c. Variabel yang mempengaruhi efisiensi produksi perkebunan kelapa sawit rakyat cukup beragam di antara penelitian yang dilakukan.

Dengan demikian, peneliti menjadi memiliki ketertarikan untuk mengadakan penelitian dengan judul **Kajian Efisiensi Produksi Perkebunan Kelapa Sawit Rakyat di Provinsi Sumatera Utara**. Kajian dilakukan dengan menggunakan Uji Regresi Non Linier Berganda, *Data Envelopment Analysis (DEA)* dan *Censored Tobit Regression*. Penggunaan DEA dan *Censored Tobit Regression* merupakan hal yang relatif baru dalam penelitian sejenis.

## 1.2 Rumusan Masalah

Berdasarkan uraian pada latar belakang di atas, maka masalah dalam penelitian ini dapat dirumuskan sebagai berikut:

- a. Bagaimana pengaruh faktor produksi utama terhadap produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.
- b. Apakah proses produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara sudah dalam keadaan yang efisien.
- c. Bagaimana pengaruh faktor produksi penunjang terhadap efisiensi produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.

### 1.3 Tujuan Penelitian

Berdasarkan rumusan masalah di atas, maka tujuan penelitian ini adalah untuk:

- a. Mengetahui bagaimana pengaruh faktor produksi utama terhadap produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.
- b. Mengetahui efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif) perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.
- c. Mengetahui bagaimana pengaruh faktor produksi penunjang terhadap efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif) perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.

### 1.4 Manfaat Penelitian

Penelitian ini diharapkan bermanfaat untuk memberikan masukan kepada pemangku kepentingan dalam pengembangan perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara, antara lain :

- a. Memberikan rekomendasi kepada petani dalam rangka peningkatan produksi dan efisiensi produksi.
- b. Memberikan rekomendasi tentang upaya-upaya yang dapat dilakukan oleh petani dan pengambil kebijakan dalam rangka peningkatan produksi dan efisiensi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.

### 1.5 Ruang Lingkup Penelitian

Ruang lingkup penelitian ini adalah berupa kajian tentang produksi, efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif) dan faktor yang mempengaruhi efisiensi produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara. Dengan demikian, ruang lingkup penelitian meliputi:

- a. Pencatatan dan perhitungan nilai faktor produksi utama (input) dan produksi yang diperoleh (output) pada proses produksi.
- b. Membentuk fungsi produksi.
- c. Melakukan analisis pengaruh faktor produksi utama terhadap produksi.
- d. Perhitungan nilai efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif).

- e. Perhitungan tingkat penggunaan input untuk mencapai keadaan efisien.
- f. Pencatatan dan perhitungan nilai faktor produksi penunjang yang mempengaruhi efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif).
- g. Melakukan analisis pengaruh faktor produksi penunjang terhadap efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif).

## 1.6 Keaslian Penelitian

Penelitian ini diharapkan dapat memberi kebaruan yang bermanfaat bagi pengembangan keilmuan maupun dalam upaya pengembangan perkebunan kelapa sawit rakyat. Hal tersebut dapat dicapai melalui upaya sebagai berikut :

- a. Perhitungan efisiensi produksi perkebunan kelapa sawit rakyat dilakukan dengan menggunakan *Data Envelopment Analysis* (DEA) yang menggunakan metode non parametrik sehingga lebih fleksibel dalam penggunaannya. Pada penelitian sebelumnya, hampir semua penelitian tentang efisiensi produksi perkebunan kelapa sawit rakyat menggunakan metode *Stochastic Frontier Analysis* dengan aturan yang ketat terutama dalam penerapan Uji Asumsi Klasik sebagai uji persyaratan analisis.
- b. Penelitian efisiensi produksi perkebunan kelapa sawit rakyat yang sebelumnya dilakukan, pada umumnya hanya menghitung efisiensi teknis sehingga belum menggambarkan tingkat efisiensi pengelolaan perkebunan kelapa sawit rakyat secara menyeluruh. Penelitian yang akan dilakukan mencakup perhitungan efisiensi teknis, efisiensi harga dan efisiensi ekonomis. Dengan demikian akan diperoleh gambaran tentang upaya yang dapat dilakukan demi peningkatan efisiensi produksi perkebunan rakyat secara menyeluruh.
- c. Penelitian pengaruh faktor yang mempengaruhi efisiensi perkebunan kelapa sawit rakyat yang telah dilakukan sebelumnya secara umum menggunakan Fungsi Cobb Douglas. Penelitian yang akan dilakukan menggunakan *Censored Tobit Analysis* yang memungkinkan variabel sosial ekonomi yang lebih beragam dalam bentuk *dummy variable*. Hal ini adalah sesuatu yang relatif baru dalam penelitian efisiensi perkebunan kelapa sawit rakyat.

## II. LANDASAN TEORI

### 2.1 Tinjauan Pustaka

#### 2.1.1 Sejarah Tanaman Kelapa Sawit

Kelapa sawit (*Elaeis guineensis*) bukanlah merupakan tanaman asli Indonesia. Tanaman kelapa sawit berasal dari Afrika Barat dan Afrika Tengah (Irawan, 2018). Sejarah kelapa sawit di Indonesia bermula dengan empat biji kelapa sawit yang dibawa oleh Dr. D. T. Pryce pada tahun 1848 (Hanggoro, 2019). Dua biji berasal dari *Hortus Botanicus* Amsterdam di Belanda, dan yang lainnya dari Bourbon Mauritius. Empat biji kelapa sawit tersebut berhasil tumbuh dengan baik di Kebun Raya Bogor yang dipimpin oleh Johannes Elyas Teysman. Pohon kelapa sawit tertua di Asia Tenggara berada di Kebun Raya Bogor, yang mencapai ketinggian 12 meter (Antara Jatim, 2013).

Pohon kelapa sawit di Kebun Raya Bogor pertama sekali menghasilkan buah pada Tahun 1853, yaitu setelah tanaman berumur lima tahun. Biji yang dihasilkan tersebut kemudian disebarluaskan ke berbagai tempat, termasuk pada Tahun 1875 dibawa ke Sumatera untuk ditanam di pinggir jalan sebagai tanaman hias. Tanpa diduga-duga sebelumnya, tanaman kelapa sawit tumbuh dengan baik di daerah Deli Sumatra Utara, yang kemudian dikenal sebagai kelapa sawit jenis Deli Dura (Antara Jatim, 2013).

Karena mereka lebih mengenal minyak kelapa, orang Belanda awalnya tidak terlalu memperhatikan kelapa sawit, tetapi terjadinya revolusi industri pada Tahun 1750-1850 di Eropa menyebabkan permintaan masyarakat terhadap minyak menjadi meningkat, yang mendorong pemerintah Hindia Belanda untuk mencoba menanam kelapa sawit di beberapa tempat. Pemerintah Hindia Belanda menanam kelapa sawit kedua di Palembang, Muara Enim Tahun 1870 dan Belitung Tahun 1890.

Hal yang sama dilakukan antara Tahun 1856 dan Tahun 1870 di Kresidenan Banyumas, tetapi meskipun berbuah lebih cepat empat tahun daripada di Afrika yang membutuhkan waktu enam hingga tujuh tahun, buah kelapa sawit yang dihasilkan menghasilkan minyak yang tidak baik. Begitu juga yang terjadi di Palembang, karena cuaca yang tidak sesuai maka hasil kelapa sawit yang diperoleh tetap jelek. Penanaman kelapa sawit di Banten dimulai Tahun 1895 yaitu dibangunnya perkebunan kelapa sawit (Sitompul, 2020).

Setelah pada Tahun 1870 diberlakukan undang-undang agraria (*Agrarisch Wet*) oleh pemerintah Hindia Belanda, maka kehadiran perusahaan perkebunan asing dimulai. Undang-undang ini memberi pemodal asing hak guna usaha atau *erfpacht* (Isnaeni, 2020). Pada Tahun 1911, Adrien Hallet dan K. Schadt asal Belgia mendirikan perusahaan perkebunan kelapa sawit di Pantai Timur Sumatra (Deli) dan Sungai Liat Aceh dengan luas 5.123 hektar. Perusahaan ini dikenal sebagai *Sungai Liput Cultuur Maatschappij* (Sitompul, 2020 dan Antara Jatim, 2013).

Pada Tahun 1911, terdapat tujuh perusahaan kelapa sawit di Aceh Timur, di antaranya *Onderneming Soengei Lipoet*, *Onderneming Kuala Simpang*, *N. V Moord Sumatra Rubber Maatschappij*, *Onderneming Soengei Ijoe*, Tanjung Suemanto, Batang Ara, serta Mopoli, yang mayoritas memiliki kebun karet. Pada tahun 1912, terdapat 18 konsesi untuk kelapa sawit dan kebun karet di Aceh Timur. Keadaan pada Tahun 1923 menunjukkan terdapat 20 perusahaan perkebunan, dengan 12 perusahaan karet, tujuh kelapa sawit, dan satu kelapa (Simangunsong and Suprayitno, 2019).

Perusahaan kebun AVROS (*Algemene Vereniging voor Rubberplanters ter Oostkus van Sumatera*) didirikan di wilayah Sumatra Utara dan Rantau Panjang Kuala Selangor (Antara Jatim, 2013). AVROS juga membantu berbagai perusahaan perkebunan yang menghadapi masalah yang sama misalnya kekurangan pekerja, hubungan sesama pengusaha, berkomunikasi dengan pemerintah serta menangani masalah transportasi. Pada 26 September 1916, AVROS mendirikan APA (*Algemeene Proefstation der AVROS*) sebagai pusat penelitian perkebunan. Semula APA didirikan sebagai tempat penelitian tentang budidaya karet, tetapi kemudian mengalami perkembangan untuk melakukan penelitian tentang kelapa sawit dan juga teh. Di Dolok Ilir kemudian dibangun balai penelitian kelapa sawit oleh HVA (*Handle Vereeniging Amsterdam*). Di sana, mereka mengembangkan varietas Pisifera yang unggul. Tahun 1921, pada kegiatan *5th International of Exhibition Rubber and Other Tropical Products* di London, APA mendapatkan penghargaan. Pada Tahun 1924, mereka kembali mendapatkan penghargaan di ajang serupa di Brussels (PPKS, 2020).

Untuk pertama kalinya, pada Tahun 1919 minyak sawit dari kebun di Pesisir Timur Sumatra mulai diekspor ke luar Hindia Belanda, namun produksi minyak sawit

mengalami penurunan akibat Perang Dunia Pertama dan baru kembali pulih setelah Depresi Besar pada tahun 1921. Luas lahan perkebunan minyak sawit meningkat dari 414 hektar menjadi 18.801 hektar pada tahun 1924. Di Pulau Jawa, bermunculan pabrik-pabrik kecil yang mengolah minyak sawit untuk memproduksi mentega dan sabun (Sitompul, 2020).

Pengelolaan perkebunan diambil alih pemerintah pada tahun 1957 yaitu setelah Belanda dan Jepang meninggalkan Indonesia. Untuk memastikan kegiatan produksi berjalan lancar, oleh pemerintah Indonesia ditempatkanlah perwira-perwira militer di setiap tingkatan manajemen perkebunan karena alasan politik dan keamanan yang belum mendukung. Kemudian pemerintah membentuk BUMIL, yang merupakan organisasi kerja sama antara buruh perkebunan dan militer. Produksi kelapa sawit menurun sebagai akibat dari perubahan manajemen di perkebunan, situasi sosial politik yang kurang mendukung dan instabilitas keamanan dalam negeri. Akibatnya, Malaysia mengambil alih posisi Indonesia sebagai negara produsen minyak sawit terbesar di dunia. Pada pemerintahan Orde Baru, pengembangan perkebunan diprioritaskan demi menciptakan kesempatan kerja, meningkatkan kualitas kesehatan masyarakat dan meningkatkan ekonomi negara. Pembukaan lahan perkebunan baru terus didorong oleh pemerintah. Pada Tahun 1980, luas perkebunan kelapa sawit Indonesia telah mencapai 294.560 ha, dengan produksi CPO (*Crude Palm Oil*) sebesar 721.172 ton. Setelah itu, perkebunan kelapa sawit Indonesia berkembang dengan pesat, termasuk perkebunan rakyat. Kebijakan pengembangan perkebunan yang dibuat pemerintah melalui pelaksanaan program Perusahaan Inti Rakyat Perkebunan (PIR – BUN) sangat mendukung kinerja perkebunan Indonesia (Nora and Mual, 2018).

### 2.1.2 Kelapa Sawit Masa Kini

Seiring dengan peningkatan pendapatan masyarakat, permintaan minyak nabati secara global terus meningkat. Permintaan diperkirakan akan naik menjadi 310 juta metrik ton pada tahun 2050 dari 205 juta metrik ton pada tahun 2019 (Byerlee et al., 2016). Minyak sawit, minyak kedelai, minyak canola, dan minyak biji bunga matahari adalah jenis minyak nabati yang paling umum digunakan. Dalam beberapa dekade

terakhir, minyak sawit yang merupakan hasil ekstraksi dari daging buah kelapa sawit, telah menjadi komoditas nabati yang paling menarik dan paling banyak digunakan di dunia. Hal tersebut bisa terjadi oleh karena biaya produksi yang rendah dan stabilitas harga minyak di pasar nasional dan global (Yean and ZhiDong, 2012). Karena menghasilkan produk turunan yang dapat digunakan sebagai bahan makanan, kosmetik, deterjen, plastik, bahan kimia industri, dan biofuel, minyak sawit sangat dihargai di pasar lokal, regional, dan internasional (Gatti et al., 2019).

Sektor pertanian masih memainkan peran yang signifikan dalam ekonomi Indonesia. Selama Tahun 2018 hingga Tahun 2021, lapangan usaha pertanian secara keseluruhan termasuk di dalamnya kehutanan dan perikanan, menduduki peringkat kedua terbesar kontribusinya terhadap Produk Domestik Bruto (PDB) Indonesia, dengan rata-rata 13,22% terhadap PDB. Dalam hal ini terlihat bahwa subsektor perkebunan memberikan kontribusi terbesar yaitu sebesar 3,94 % terhadap PDB Indonesia (Kementerian Pertanian, 2022).

Salah satu komoditas hasil perkebunan yang paling penting dan memberikan kontribusi yang signifikan terhadap aktivitas ekonomi Indonesia adalah kelapa sawit. Hal ini disebabkan oleh fakta bahwa komoditas kelapa sawit memiliki kemampuan untuk menghasilkan minyak nabati yang sangat dibutuhkan oleh industri. Dengan luasan tutupan lahan kelapa sawit 16,38 juta hektar dan produksi 46,8 juta ton CPO, industri kelapa sawit Indonesia masih memiliki pengaruh terhadap ekonomi nasional yang signifikan. Hal ini dapat dilihat dari banyak hal, salah satunya adalah industri sawit telah menyerap lebih dari 16 juta orang. Selain itu, biodiesel (program B20 dan B30 sebesar 9,3 juta ton pada tahun 2020) dan listrik dari 879 PKS sebesar 1.829 MW telah digunakan oleh industri kelapa sawit untuk menggantikan bahan bakar fosil. Ini terus menjadi andalan kinerja neraca perdagangan nasional. Ini ditunjukkan oleh kontribusinya yang mencapai 13,50% terhadap ekspor nonmigas dan 3,50 % terhadap total PDB Indonesia (Kementerian Pertanian, 2022).

Kementerian Pertanian (2022) menyatakan bahwa, dari sudut pandang ekspor sektor pertanian kelapa sawit memiliki peran penting dalam meningkatkan devisa ekonomi Indonesia pada Tahun 2021. Subsektor yang berkontribusi terbesar terhadap

ekspor pertanian adalah perkebunan. Nilai ekspor minyak kelapa sawit (CPO dan turunannya) adalah sebesar US\$ 27,6 miliar, dengan tingkat pertumbuhan sebesar 58,79 % dibandingkan tahun sebelumnya yang mewakili 96,86 % dari total nilai ekspor pertanian dengan kontribusi sebesar 73,83 persen. Keadaan ini lah yang telah menjadikan kelapa sawit sebagai komoditas yang sangat penting dalam perkembangan sektor pertanian dan telah menjadikannya komoditas unggulan untuk ekspor Indonesia.

### 2.1.3 Bentuk Usaha Perkebunan Kelapa Sawit

Menurut Undang-Undang Republik Indonesia Nomor 39 Tahun 2014 tentang Perkebunan, perkebunan adalah segala kegiatan yang berkaitan dengan pengelolaan sumber daya alam, sumber daya manusia, sarana produksi, alat dan mesin, budi daya, panen, pengolahan, dan pemasaran tanaman perkebunan. Adiani (2021) membagi perkebunan berdasarkan jenis bisnisnya menjadi dua kategori yaitu:

- a. Perkebunan rakyat, perkebunan ini dikelola oleh perorangan atau pihak swasta dalam skala kecil, membutuhkan modal atau investasi yang kecil, sistem pengairan lahan masih sederhana, dan tenaga kerjanya tidak terlalu banyak. Luas lahan yang digunakan tidak terlalu luas.
- b. Perkebunan besar, perkebunan yang melibatkan penggunaan lahan yang sangat luas, biaya atau modal yang tinggi, dan dikelola oleh pihak swasta nasional atau pemerintah yang membutuhkan banyak tenaga kerja dan teknologi modern.

Peraturan Menteri Pertanian Nomor 98 Tahun 2013 (Permentan, 2013) tentang Pedoman Perizinan Usaha Perkebunan menyatakan bahwa khusus untuk tanaman kelapa sawit, perkebunan sawit rakyat adalah perkebunan sawit yang dikelola oleh masyarakat dengan luas kurang dari 25 hektar. Seperti dinyatakan oleh Hidayati et al. (2016), masalah rendahnya produktivitas adalah masalah yang sering terjadi di perkebunan kelapa sawit di Indonesia. Jenis tanah, jenis bibit, iklim, dan teknologi yang digunakan adalah faktor yang sangat memengaruhi produksi kelapa sawit. Hasil produksi kebun sawit rakyat dan swasta sangat berbeda jika dibandingkan dengan kondisi tanah yang sama. Produksi kebun kelapa sawit di Indonesia pada umumnya adalah antara 20 hingga 25 ton TBS/ha/tahun, atau sekitar 4 hingga 5 ton CPO/ha/tahun. Beberapa hal yang kurang mendukung perkembangan kelapa sawit di Provinsi Sumatera Utara adalah

industri hilir kelapa sawit yang belum berkembang, produk yang diekspor masih berbentuk CPO serta masih kurangnya penerapan teknologi, manajemen usaha dan rendahnya kualitas sumberdaya manusia yang terlibat dalam pengelolaan perkebunan kelapa sawit.

Peningkatan produksi perkebunan kelapa sawit dapat dilakukan melalui penggunaan bibit kelapa sawit dan penerapan kultur teknis yang unggul. Tindakan budidaya dan faktor lingkungan tumbuh sangat menentukan tingkat produktivitas. Faktor utama yang mempengaruhi produksi kelapa sawit adalah lingkungan. Pada hakekatnya, pengelolaan lingkungan tumbuh tanaman kelapa sawit relatif lebih mudah jika dibandingkan dengan aktivitas budidaya seperti penggunaan bahan tanaman yang unggul, pengaturan jarak tanam, pemupukan, pengendalian hama dan penyakit tanaman serta perlindungan tanaman (PPKS, 2020).

#### **2.1.4 Perkebunan Kelapa Sawit Rakyat Indonesia**

Sesuai dengan informasi dari *Palm Oil Agribusiness Strategic Policy Institute* (PASPI) Indonesia, berikut ini adalah uraian keberadaan perkebunan kelapa sawit rakyat di Indonesia saat ini (Sipayung, 2024).

##### **a. Sejarah dan Pertumbuhan Perkebunan Kelapa Sawit Rakyat**

Sejarah kelapa sawit di Indonesia dimulai setelah pemerintah kolonial Belanda memperkenalkan kelapa sawit sebagai tanaman perkebunan pada awal tahun 1800-an. Meskipun pada awalnya kelapa sawit ditanam sebagai tanaman hias, tetapi kelapa sawit akhirnya dikenal merupakan sumber minyak nabati yang berharga. Sejak saat itu, kelapa sawit telah berkembang menjadi komoditas ekspor yang penting bagi Indonesia, dengan perkebunan kelapa sawit besar menjadi pemain utama dalam proses produksi minyak kelapa sawit. Namun, seiring waktu, pemerintah Indonesia mulai mendorong partisipasi rakyat dalam perkebunan sawit untuk diversifikasi kepemilikan dan memperkuat ekonomi lokal.

Perkembangan yang pesat dalam perkebunan kelapa sawit rakyat di Indonesia dimulai pada awal pemerintahan orde baru. Pemerintah Indonesia berkeinginan untuk memperoleh devisa negara melalui usaha perkebunan secara besar-besaran terutama kelapa sawit. Pembangunan perkebunan kelapa sawit di Indonesia tersebut dilaksanakan

untuk peningkatan kesejahteraan rakyat, penciptaan kesempatan kerja dan sebagai lapangan usaha penghasil devisa negara. Secara berkelanjutan, pemerintah Indonesia mendorong pembukaan lahan baru sebagai lahan perkebunan, salah satunya melalui pola Perusahaan Inti Rakyat Perkebunan (PIRBUN) yang didukung dengan kebijakan pemerintah yaitu penerapan Perusahaan Inti Rakyat-Transmigrasi (PIR-Trans) pada Tahun 1986.

Luas perkebunan kelapa sawit rakyat telah meningkat pesat dalam beberapa dekade terakhir, seperti yang ditunjukkan oleh data dari Badan Pusat Statistik (BPS) Indonesia. Evolusi luas perkebunan kelapa sawit rakyat dari tahun ke tahun adalah sebagai berikut:

- 1) Sebanyak 1.190.200 hektar perkebunan sawit rakyat tercatat pada Tahun 2000.
- 2) Areal tersebut meningkat menjadi sekitar 2.500.000 hektar pada Tahun 2010, dengan peningkatan yang konsisten.
- 3) Areal terus berkembang dengan cepat, mencapai lebih dari 4.500.000 hektar pada Tahun 2015.
- 4) Data menunjukkan bahwa perkebunan sawit rakyat telah mencapai 6.000.000 hektar pada Tahun 2021.

Pertumbuhan ini menunjukkan peran penting perkebunan kelapa sawit rakyat dalam industri kelapa sawit secara luas dan menunjukkan potensi besar untuk pengembangan kualitas dan produktivitas di masa mendatang.

#### **b. Kontribusi Perkebunan Kelapa Sawit Rakyat**

Peranan perkebunan kelapa sawit rakyat sangat penting bagi industri kelapa sawit Indonesia. Produksi kelapa sawit nasional yang bersumber dari perkebunan kelapa sawit rakyat memberikan kontribusi signifikan. Peningkatan kepemilikan lahan perkebunan kelapa sawit rakyat bukan hanya mampu berperan dalam peningkatan volume produksi CPO, tetapi juga dapat meningkatkan keberagaman produksi dan ketahanan industri terhadap perubahan harga.

Ditinjau dari perspektif ekonomi lokal, maka perkebunan kelapa sawit rakyat sering kali menjadi tulang punggung ekonomi di banyak daerah khususnya di luar Pulau Jawa. Perkebunan kelapa sawit rakyat menjadi penyedia lapangan kerja yang besar dan

telah menjadi sumber pendapatan yang cukup stabil bagi masyarakat pedesaan. Perkebunan sawit rakyat juga dapat membantu mengurangi ketimpangan sosial-ekonomi, karena pendapatan dari perkebunan kelapa sawit relatif lebih merata dan tersebar di antara populasi penduduk. Secara khusus, perkebunan kelapa sawit rakyat membantu perekonomian daerah melalui:

- 1) Pendapatan petani. Petani kelapa sawit rakyat memperoleh uang dari penjualan tandan buah segar (TBS) yang merupakan bahan baku utama CPO. Perolehan pendapatan tersebut sangat penting bagi mereka dalam memenuhi keperluan harian mereka serta meningkatkan kualitas kehidupan keluarga petani.
- 2) Pengembangan usaha terkait. Usaha perkebunan kelapa sawit rakyat mendorong pertumbuhan kelompok usaha yang terkait seperti jasa pengolahan, pengangkutan serta sarana produksi.
- 3) Investasi di daerah. Seringkali, pendapatan petani yang berasal dari perkebunan kelapa sawit rakyat akan dijadikan investasi di masyarakat yang dapat meningkatkan siklus perekonomian daerah.
- 4) Pajak daerah. Berbagai pajak dan retribusi yang terkait dengan kegiatan perkebunan kelapa sawit berkontribusi pada PAD daerah.

Perkebunan kelapa sawit rakyat secara tidak langsung berkontribusi dalam menciptakan nilai tambah pada industri hilir seperti industri pengolahan dan pemasaran produk kelapa sawit. Peran dalam rantai pasok kelapa sawit akan dapat meningkatkan keberadaan Indonesia di pasar komoditas ini di seluruh dunia. Dengan kata lain, perkebunan kelapa sawit rakyat bukan hanya memainkan peranannya dalam produksi kelapa sawit nasional, tetapi juga membangun lingkungan ekonomi yang berkelanjutan dan inklusif. Eksistensi yang kuat dan produktif perkebunan kelapa sawit rakyat akan terus mendorong pertumbuhan ekonomi Indonesia dari akar rumput hingga skala nasional.

### **c. Tantangan Yang Dihadapi Perkebunan Kelapa Sawit Rakyat**

Meskipun memainkan peran yang signifikan dalam ekonomi Indonesia, perkebunan kelapa sawit rakyat menghadapi sejumlah masalah sehingga menjadi

penghambat pertumbuhan dan efisiensinya. Skalabilitas, pembiayaan, dan teknologi adalah beberapa masalah yang memengaruhi keberlanjutan dan operasional perkebunan.

- 1) Skalabilitas Perkebunan kelapa sawit rakyat biasanya lebih kecil daripada perkebunan kelapa sawit besar. Keterbatasan sumber daya dan lahan dapat menyebabkan skala efisiensi yang rendah, yang dapat meningkatkan biaya produksi. Lahan yang tersebar dan kecil juga menyulitkan pengelolaan yang terpadu dan seringkali menghasilkan produktivitas yang lebih rendah.
- 2) Pembiayaan. Akses ke modal dan pembiayaan adalah salah satu masalah terbesar yang dihadapi oleh perkebunan kelapa sawit rakyat. Petani sering kesulitan mendapatkan kredit karena persyaratan jaminan dan perbankan yang ketat. Ini membuat mereka bergantung pada pinjaman dari lembaga non-resmi atau modal dengan bunga yang tinggi yang dapat memperkecil keuntungan petani.
- 3) Teknologi. Perkebunan kelapa sawit rakyat sering tertinggal dalam penggunaan teknologi dibandingkan dengan perusahaan perkebunan besar. Penghambat utama adalah kurangnya pengetahuan dan kemampuan untuk menggunakan teknologi terbaru seperti penggunaan bibit unggul, metode budidaya yang maju, dan teknik pascapanen yang efektif. Hal ini menyebabkan operasi yang tidak efisien dan produk yang tidak berkualitas.
- 4) Pengetahuan dan pelatihan. Petani kelapa sawit rakyat seringkali kekurangan pengetahuan tentang praktik terbaik perkebunan kelapa sawit. Mereka tidak dapat memaksimalkan potensi produksi mereka dan menghadapi kesulitan dalam mengelola perkebunan secara berkelanjutan karena mereka tidak menerima pelatihan dan informasi yang tepat.
- 5) Pasar dan infrastruktur. Akses ke pasar dan infrastruktur yang kurang memadai adalah masalah berikutnya. Petani kelapa sawit rakyat sering menghadapi masalah dalam menjangkau pasar yang lebih luas dan mendapatkan harga yang kompetitif untuk produk mereka. Infrastruktur yang tidak memadai, seperti jalan dan tempat penyimpanan, meningkatkan biaya transportasi dan meningkatkan risiko kerusakan produk.

- 6) Regulasi dan kebijakan. Selain itu, kebijakan dan peraturan kadang-kadang tidak mendukung atau bahkan memberatkan perkebunan kelapa sawit rakyat. Peraturan yang sering berubah-ubah dan birokrasi yang rumit dapat menghalangi kemajuan perkebunan kelapa sawit rakyat.

Untuk mengatasi masalah tersebut di atas, diperlukan pendekatan yang luas. Pendekatan ini harus mencakup kebijakan pemerintah, inisiatif sektor swasta, dan kemitraan lembaga penelitian untuk mengembangkan teknologi yang sesuai dengan kebutuhan pengembangan perkebunan kelapa sawit rakyat. Dengan bekerja sama, potensi perkebunan kelapa sawit rakyat dapat dioptimalkan untuk meningkatkan produktivitas dan meningkatkan kontribusi mereka terhadap ekonomi nasional.

#### **d. Strategi Peningkatan Produktivitas**

Untuk memperkuat posisi kelapa sawit rakyat Indonesia di pasar global dan meningkatkan kesejahteraan petani, peningkatan produktivitas adalah hal yang sangat penting. Demi mencapai tujuan ini, berbagai pendekatan telah diidentifikasi dan diterapkan, dengan penekanan utama pada pemberdayaan petani dan pemanfaatan teknologi, antara lain:

- 1) Penggunaan varietas unggul. Salah satu strategi utama adalah penggunaan varietas atau benih unggul yang telah melalui proses pemuliaan. Varietas ini lebih potensial menghasilkan produksi yang lebih tinggi, lebih tahan terhadap penyakit, dan lebih tahan terhadap perubahan iklim.
- 2) Manajemen kebun yang baik. Untuk mengurangi kerugian dan meningkatkan kualitas hasil maka perlu diterapkan praktik pertanian yang baik (Good Agricultural Practices atau GAP) termasuk pemeliharaan tanaman yang tepat, pengendalian hama dan penyakit, dan teknik panen yang efisien.
- 3) Peningkatan akses ke pembiayaan. Memfasilitasi akses petani ke pembiayaan melalui koperasi atau skema kredit mikro dapat memungkinkan mereka untuk berinvestasi dalam meningkatkan kebun mereka dan membeli input produksi berkualitas tinggi.
- 4) Pelatihan dan penyuluhan. Program pelatihan dan penyuluhan bagi petani kelapa sawit rakyat meningkatkan keahlian dan pengetahuan tentang budidaya kelapa sawit.

Pelatihan dapat mencakup hal-hal seperti teknik budidaya, pengelolaan, dan pemasaran.

- 5) Penerapan teknologi pertanian. Penggunaan teknologi pertanian modern, seperti penggunaan alat mekanis, sistem irigasi yang efektif, dan aplikasi digital untuk manajemen kebun, dapat meningkatkan produktivitas dan efisiensi kerja.
- 6) Diversifikasi produksi. Petani dapat mengurangi risiko pasar dan meningkatkan pendapatan melalui diversifikasi dengan tanaman lain atau integrasi dengan peternakan.

Program peremajaan kebun kelapa sawit (replanting) yang telah diterapkan oleh pemerintah Indonesia dengan melakukan kerja sama dengan berbagai institusi seperti Badan Pengelola Dana Perkebunan Kelapa Sawit (BPDPKS) adalah contoh keberhasilan program tersebut. Program tersebut bertujuan untuk melakukan penggantian tanaman kelapa sawit yang tua dan tidak produktif dengan varietas yang lebih unggul. Selain itu, program ini membantu petani dalam proses peremajaan dan memberikan kredit dengan bunga rendah.

Selain itu, telah terbukti bahwa penggunaan aplikasi digital untuk manajemen kebun meningkatkan efisiensi. Aplikasi ini memungkinkan petani untuk memantau kondisi kebun mereka, mendapatkan informasi tentang praktik terbaik, dan mendapatkan akses ke pasar sehingga mereka dapat menjual produk mereka dengan lebih efektif dan efisien.

Dengan penerapan strategi-strategi tersebut di atas, maka diharapkan perkebunan sawit rakyat dapat meningkatkan produktivitas, yang pada gilirannya akan meningkatkan pendapatan petani dan mendorong pertumbuhan ekonomi lokal dan nasional.

#### **e. Pemasaran dan Distribusi**

Perkebunan kelapa sawit rakyat harus berhasil dalam industri kelapa sawit dengan menggunakan strategi pemasaran dan distribusi yang efektif. Dalam menghadapi pasar yang kompetitif, perkebunan kelapa sawit rakyat harus menggunakan pendekatan yang inovatif dan berkelanjutan, seperti yang tercantum di bawah ini:

- 1) Pemasaran langsung ke pabrik. Banyak perkebunan sawit rakyat memilih untuk menjual tandan buah segar (TBS) langsung ke pabrik kelapa sawit. Hal ini

memungkinkan petani mendapatkan harga yang lebih baik karena mereka tidak perlu menggunakan tengkulak atau perantara.

- 2) Koperasi petani. Salah satu metode pemasaran yang memungkinkan petani bersatu untuk meningkatkan daya tawar mereka adalah koperasi. Koperasi juga membantu mengumpulkan dan mendistribusikan produk petani ke pabrik, seringkali dengan hasil yang lebih menguntungkan bagi petani.
- 3) Pemanfaatan teknologi informasi. Petani mendapat bantuan dalam memasarkan produk mereka melalui penggunaan teknologi informasi, seperti platform digital dan aplikasi seluler. Aplikasi media sosial dan *e-commerce* memungkinkan petani untuk mengikuti perkembangan harga secara *real-time*.
- 4) Jaringan distribusi yang terorganisir. Untuk memastikan kelapa sawit sampai ke pabrik dengan kualitas terjaga dan mengurangi kerusakan dan kehilangan, jaringan distribusi yang terorganisir, termasuk penyimpanan yang tepat, sangatlah penting.
- 5) Produk nilai tambah. Perkebunan kelapa sawit rakyat yang menghasilkan produk bernilai tambah dari kelapa sawit, seperti minyak goreng, sabun, dan kosmetik, dapat memperoleh pasar baru dan meningkatkan keuntungan mereka.
- 6) Sertifikasi dan *Branding*. Mendapatkan sertifikasi untuk praktik pertanian berkelanjutan dan membangun *brand* dapat meningkatkan kredibilitas dan memperluas akses pasar. Ini juga memungkinkan petani untuk menjual produk mereka dengan harga premium.

#### **f. Relevansi Pemasaran dan Distribusi Efektif dalam Peningkatan Nilai Tambah Bagi Petani**

Peningkatan nilai tambah yang dihasilkan petani langsung terkait dengan pemasaran dan distribusi yang efektif. Petani dapat memperoleh margin keuntungan yang lebih tinggi dengan meningkatkan pemasaran dan distribusi produk mereka. Petani meningkatkan pendapatan mereka dan dapat berinvestasi kembali dalam perkebunan mereka karena keuntungan ini, seperti dengan membeli input pertanian yang lebih baik atau teknologi yang lebih maju, yang meningkatkan produktivitas dan kualitas produk.

Selain itu, perkebunan kelapa sawit rakyat dapat mempertahankan stabilitas pendapatan yang berkelanjutan dan menjadi lebih tahan terhadap perubahan pasar dengan

menggunakan strategi pemasaran dan distribusi yang kuat. Oleh karena itu, peningkatan dalam aspek pemasaran dan distribusi dapat memberikan dasar yang kuat untuk pertumbuhan dan keberlanjutan perkebunan kelapa sawit rakyat di Indonesia dalam jangka panjang.

#### **g. Kebijakan Pemerintah dan Dukungan**

Pemerintah Indonesia menyadari peran perkebunan kelapa sawit rakyat dalam industri kelapa sawit dan telah mengeluarkan beberapa kebijakan demi mendukung dan memperkuat sektor ini. Kebijakan tersebut dilakukan untuk memastikan bahwa perkebunan kelapa sawit rakyat dapat bersaing di pasar global serta meningkatkan produktivitas, efisiensi, dan keberlanjutannya. Kebijakan tersebut termasuk:

- 1) Kebijakan *replanting*. Salah satu program utama pemerintah adalah *replanting* atau peremajaan kebun, yang bertujuan untuk mengganti tanaman tua dan tidak produktif dengan varietas baru yang lebih baik. Program ini juga menawarkan pembiayaan dengan syarat yang lebih mudah dan bunga yang lebih rendah.
- 2) Subsidi dan insentif. Subsidi untuk input pertanian seperti pupuk dan benih serta insentif pajak untuk teknologi pertanian dan peralatan yang dapat meningkatkan efisiensi perkebunan diberikan oleh pemerintah.
- 3) Program penyuluhan dan pelatihan. Pemerintah memberikan pelatihan dan informasi tentang praktik terbaik dalam budidaya dan pengelolaan kelapa sawit melalui program penyuluhan pertanian. Penyuluhan ini sangat penting untuk meningkatkan pengetahuan petani tentang teknik pertanian yang berkelanjutan dan efisien.
- 4) Fasilitas Kredit Usaha Rakyat (KUR). Petani dapat mendapatkan kredit dengan bunga rendah melalui fasilitas Kredit Usaha Rakyat (KUR) yang disediakan oleh pemerintah. KUR ini memungkinkan mereka untuk melakukan investasi dalam pengembangan perkebunan.
- 5) Program peningkatan kapasitas. Petani dapat memperoleh keterampilan yang lebih baik dalam mengelola kebun dan bisnis mereka melalui pelatihan teknis dan manajerial yang disediakan oleh program ini.

- 6) Sertifikasi dan standarisasi kebijakan pemerintah juga mendukung petani dengan sertifikasi ISPO (*Indonesia Sustainable Palm Oil*), yang meningkatkan akses pasar dan memberikan jaminan keberlanjutan kepada konsumen.
- 7) Dukungan untuk pemasaran dan akses pasar. Melalui program seperti pameran, kerja sama dengan perusahaan besar, dan membuka akses pasar ekspor, pemerintah membantu petani memasarkan barang mereka.

Program bantuan dan pelatihan pemerintah telah membantu petani secara signifikan dalam mengelola perkebunan secara lebih profesional dan berkelanjutan. Dengan dukungan kebijakan yang berkesinambungan, perkebunan kelapa sawit rakyat diharapkan dapat terus berkembang dan memberikan kontribusi yang lebih besar kepada ekonomi Indonesia.

### **2.1.5 Budidaya Kelapa Sawit**

Perkebunan kelapa sawit rakyat perlu mendapat perhatian khusus. Jika produktivitas perkebunan kelapa sawit rakyat tidak meningkat (stagnan rendah) oleh karena berbagai kendala yang dihadapi, maka perbedaan produktivitas antara perkebunan besar dan perkebunan rakyat akan semakin meningkat. Ini dapat menyebabkan masalah baru yang dapat dimanfaatkan oleh berbagai pihak. Berhubungan dengan hal tersebut, pemerintah telah mengeluarkan Peraturan Menteri Pertanian Nomor 131 Tahun 2013 (Permentan, 2013) tentang Pedoman Budidaya Kelapa Sawit Yang Baik, yang bertujuan untuk meningkatkan produksi dan produktivitas kelapa sawit, seperti dapat diringkas sebagai berikut.

#### **A. Persyaratan Tumbuh**

Tanaman kelapa sawit tumbuh dan berkembang dengan baik pada lahan mineral maupun lahan gambut yang memenuhi persyaratan.

##### **1. Lahan Mineral**

Tanaman kelapa sawit dapat tumbuh dengan baik di lahan mineral dengan kelas kesesuaian lahan Sangat Sesuai (S1), Sesuai (S2), dan Agak Sesuai (S3). Kelas kesesuaian lahan ini ditetapkan berdasarkan jumlah dan intensitas faktor pembatas

karakteristik lahan. Setiap kelas terdiri dari satu atau lebih unit kesesuaian yang memberikan lebih banyak detail tentang jumlah dan intensitas faktor pembatas.

## 2. Lahan Gambut:

Karena ketersediaan lahan yang terbatas, budidaya kelapa sawit dapat dilakukan pada lahan gambut, yang bukan berupa tanah mineral. Tanaman kelapa sawit dapat dibudidayakan pada lahan gambut jika memenuhi syarat-syarat berikut: (a) lahan gambut tersebut merupakan lahan milik masyarakat dan termasuk area budidaya, (b) lapisan gambut tebalnya kurang dari 3 meter, (c) Substratum tanah mineral di bawah gambut tidak terdiri dari pasir kuarsa atau tanah sulfat masam, (d) lahan gambut matang atau setengah matang, dan (e) lahan gambut memiliki tingkat kesuburan eutropik.

## B. Bahan Tanaman

Bahan tanaman yang digunakan harus berasal dari pusat sumber benih yang telah dilegalkan oleh pemerintah dan memiliki reputasi yang baik seperti Pusat Penelitian Kelapa Sawit (PPKS), PT. Socfindo, PT. PP London Sumatera Indonesia, PT. Bina Sawit Makmur, PT. Tunggal Yunus Estate, PT. Dami Mas Sejahtera, PT. Bakti Tani Nusantara, PT. Tania Selatan, PT. Sarana Inti Prasaran dan PT. Sarana Ehsan Mekar Sari. Bahan tanaman yang disarankan berasal dari persilangan Dura Deli x Pisifera.

## C. Pembenihan

Kebutuhan benih kelapa sawit adalah 140 persen dari jumlah benih karena pola tanamnya. Pembenihan meliputi seleksi benih untuk digunakan pada pembenihan awal dan pembenihan utama, penyisipan tanaman serta pengendalian kerusakan benih selama masa perjalanan. Bahan tanaman kelapa sawit diberikan dalam bentuk kecambah (germinated seed). Benih kelapa sawit yang baik adalah benih yang memiliki kekuatan, penampilan tumbuh, dan kemampuan untuk menahan kondisi cekaman lingkungan saat dilakukan pertanaman (*transplanting*).

Perencanaan yang baik dan terencana diperlukan untuk menghasilkan benih yang baik, seperti pemilihan lokasi, luas, sistem pembenihan, media tanam, dan kantong plastik atau polibag, pembenihan awal (bedengan, naungan, dan penanaman kecambah), dan pemeliharaan awal (penyiraman, pengendalian gulma, pemupukan, pengendalian hama dan penyakit, seleksi benih, pemindahan dan pengangkutan benih), pembenihan utama

meliputi persiapan dan pengolahan tanah, kebutuhan air dan instalasi penyiraman, pemasangan pipa untuk sistem gembor, penyiraman dengan sprinkler, pemancangan, pengisian tanah ke polibag, pembuatan lubang pada polibag, penanaman benih, pemeliharaan pembenihan utama, seleksi benih, dan persiapan benih untuk penanaman.

#### **D. Persiapan Lahan**

Persiapan lahan serangkaian kegiatan yang mencakup pembukaan lahan dan penanaman kelapa sawit, telah memiliki tahapan pekerjaan yang sudah ditentukan, jadi jadwal harus dipenuhi dengan tepat waktu. Studi kelayakan harus dilakukan sebelum pembukaan area dimulai. Studi ini harus membahas perencanaan kebun dan tata ruangnya.

##### **1. Desain Kebun**

Yaitu perencanaan tata ruang kebun dan afdeling, yang mencakup jaringan jalan, area pembenihan, saluran air, dan penentuan lokasi blok dan afdeling.

##### **2. Pembukaan Lahan**

Kondisi lahan yang akan dibuka untuk perkebunan kelapa sawit dapat bervariasi tergantung pada vegetasi, topografi, tata guna, dan drainase lahan. Berdasarkan kondisi vegetasi lahan yang akan dibuka untuk perkebunan kelapa sawit, terdapat beberapa kemungkinan sebagai berikut:

- a) Hutan primer adalah hutan yang sebelumnya pernah dikelola oleh manusia dan memiliki kerapatan pohon yang tinggi.
- b) Hutan sekunder adalah hutan yang telah ditinggalkan oleh manusia dan memiliki kerapatan pohon yang lebih sedikit.
- c) Areal alang-alang adalah area yang dulunya merupakan perladangan dan akhirnya tumbuh alang-alang.
- d) Areal konversi adalah area yang telah digunakan oleh manusia untuk menghasilkan barang-barang tertentu, seperti karet, kelapa sawit (untuk perawatan), kopi, dan sebagainya.

##### **3. Rintisan Areal**

Sebelum sistem yang akan digunakan dalam pembukaan areal ditentukan maka kondisinya harus dipelajari terlebih dahulu. Pada tahun pertama, rintisan dilakukan

serupa dengan studi kelayakan tetapi lebih mendalam untuk mengetahui vegetasi, topografi, sumber air dan drainase, serta batas dan luas area. Peta hasil rintisan juga digunakan untuk membuat perencanaan jalan, lokasi pemondokan sementara, pembagian blok besar dan kecil untuk persiapan pemborongan pekerjaan, arah pembukaan lahan, dan komponen lainnya.

#### 4. Pembukaan Lahan Tanpa Bakar (*zero burning*)

Pembukaan hutan tanpa bakar dapat mempertahankan dan meningkatkan kandungan bahan organik dan anorganik serta udara bersih yang bebas dari pencemaran asap. Kesuburan fisik dan kimia tanah dapat ditingkatkan jika kandungan bahan organik dan anorganik dalam tanah meningkat, termasuk di dalamnya struktur tanah yang lebih baik, kemampuan tanah menahan air yang lebih besar, kapasitas tukar kation yang lebih besar, lebih rendahnya plastisitas dan kohesi, dan peningkatan kandungan hara.

#### 5. Pengawetan Tanah

Bangunan konservasi tanah dan air yang memadai diperlukan karena kondisi topografi area yang bergelombang. Pengawetan tanah dapat dilakukan secara fisik, kimia, atau biologi. Metode pengawetan kimia biasanya tidak digunakan karena biayanya yang tinggi.

- a) Pengawetan tanah secara fisik yaitu pengawetan secara mekanis mencakup pembuatan teras kontur, teras individu (tapak kuda), dan rorak di wilayah dengan kemiringan lereng 8–30 %.
- b) Pengawetan tanah secara biologi yaitu tanaman penutup tanah (TPT) atau tanaman *cover legume cover crops* (LCC) ditanam sebelum tanaman kelapa sawit ditanam. TPT menghentikan pertumbuhan gulma, mengurangi erosi permukaan, mengurangi aliran permukaan (*run off*) dan mempertahankan kelembaban tanah. TPT juga melindungi tanah dari cahaya matahari langsung.

#### 6. Pembuatan Jalan, Jembatan dan Gorong-Gorong

##### a) Jalan

Jalan adalah sesuatu yang sangat penting dibuat dan dirawat sejak dari pembukaan kebun hingga tanaman sudah menghasilkan. Sebaiknya jalan tetap dalam kondisi baik sepanjang tahun sehingga transportasi TBS, pupuk, peralatan, dan barang lain tidak

terganggu. Pada masa TBM, jalan harus diperkeras untuk angkutan TBS. Namun, selama periode TM, kegiatan jalan hanya untuk pemeliharaan. Pada umumnya, jalan dikerasi dengan batu, pasir batu (sirtu), atau laterit. Untuk lahan gambut, disarankan untuk menimbun jalan dengan tanah mineral sebelum pengerasan dengan pasir atau batu..

#### b) Jembatan dan Gorong-Gorong

Agar pembangunan jembatan lebih mudah dan efisien di daerah dengan aliran sungai, maka jaringan jalan dibuat pada bagian sungai yang lebih kecil. Gorong-gorong cukup dibuat di sungai kecil dan dangkal. Pada lokasi yang rendah di mana air keluar dari parit, maka gorong-gorong dibuat mengikuti ukuran parit yang ada. Gorong-gorong semen biasanya digunakan, tetapi lebih baik menggunakan pipa PVC jika tersedia.

### E. Penanaman

Tanaman kelapa sawit yang ditanam baik di lapangan akan menghasilkan tanaman yang sehat (tidak ada tanaman yang abnormal atau mati yang membutuhkan benih sisipan) dan seragam, sehingga tanaman akan cepat berproduksi (kurang dari 30 bulan setelah tanam) dan menghasilkan produksi awal yang tinggi.

#### 1. Jarak Tanam

Pada tanaman kelapa sawit disarankan pola jarak tanam segitiga dengan sisi yang sama. Karakteristik tanaman, tingkat kesuburan tanah, topografi lahan dan kondisi lingkungan mempengaruhi penentuan jarak tanam. Pemancangan yang baik diperlukan untuk mencapai jarak yang teratur. Kerapatan pohon (jumlah tanaman per ha) dan produksi tandan setiap pohon sangat terkait dengan sistem jarak tanam. Kerapatan tanaman yang lebih tinggi akan berdampak pada berkurangnya ruang tumbuh tanaman. Penanaman yang terlalu rapat pada akhirnya akan menyebabkan masalah densitas tanaman, masalah penyerapan unsur hara serta terjadinya persaingan yang tinggi dalam penyerapan cahaya matahari sehingga dapat mengganggu fotosintesis tanaman. Selanjutnya, kerapatan tanaman juga akan dapat mempengaruhi *sex ratio*, berat tandan, tinggi tanaman, lingkaran batang produksi daun dan panjang daun. Demi untuk mempertahankan jumlah populasi tanaman produktif hingga umur tanaman 25 tahun, di daerah endemik *Ganoderma* disarankan untuk menanam dengan kerapatan tanaman 148-150 pohon per ha.

## 2. Pemancangan

Mengatur letak tanaman dengan cara tertentu sehingga jelas jarak antar barisan dan jarak dalam barisan dikenal sebagai pemancangan. Ini dilakukan untuk mencegah dan mengatasi kekurangan sinar matahari, yang dapat mengubah bentuk tanaman. Jalan tanaman kelapa sawit biasanya berarah Utara-Selatan, tetapi kadang-kadang dapat diubah untuk menyesuaikan dengan topografi lahan yang akan ditanami. Pemancangan di area yang rata/datar tidaklah sulit; pemancangan dilakukan dengan menjaga agar jarak antara barisan harus sama. Tata pengelolaan penanaman menentukan arah barisan dan jarak tanam di wilayah berbukit.

## 3. Penanaman

Proses penanaman bibit tanaman mencakup hal-hal berikut:

- a) Persiapan penanaman, yang mencakup pengangkutan bibit ke lokasi penanaman dan persyaratan lahan yang dapat ditanam.
- b) Membentuk lobang tanam.
- c) Pengantaran bibit.
- d) Penanaman menggunakan metode penanaman yang telah ditentukan sebelumnya.

## F. Pemeliharaan Tanaman

### 1. Tanaman Belum Menghasilkan

Tanaman yang dipelihara dari bulan penanaman pertama hingga dipanen pada umur tiga puluh hingga enam puluh bulan disebut tanaman belum menghasilkan (TBM). Pada masa TBM 1, beberapa pekerjaan rutin yang harus dilakukan termasuk konsolidasi tanaman, penyisipan tanaman, pemeliharaan piringan pohon, pemeliharaan penutup tanah, pemupukan, tunas pasir, pengendalian hama dan penyakit, persiapan pemanenan, dan perawatan jalan dan parit drainase. Hal yang dilakukan pada pemeliharaan masa TBM adalah perpanjangan atau penyempurnaan pekerjaan ketika pembukaan lahan dan pemeliharaan tanaman sehingga menghasilkan tanaman yang tumbuh dengan baik.

### 2. Tanaman Menghasilkan

Tanaman kelapa sawit mulai mengeluarkan bunga pada umur sepuluh hingga dua belas bulan setelah tanam dan menghasilkan panen yang baik ketika tanaman berumur

dua tahun enam bulan atau tiga puluh bulan. Setiap ketiak pelepah daun mengandung bunga jantan atau betina; setelah prose anthesis, bunga jantan akan gugur. Tanaman kelapa sawit akan menghasilkan produksi yang luar biasa jika dipelihara dengan baik. Pemeliharaan tanaman menghasilkan (TM) meliputi pemupukan tanaman, perawatan jalan kebun, pengendalian hama dan penyakit yang mengganggu, penunasan pelepah tanaman, dan pengendalian gulma di sekitar tanaman.

## **G. Panen**

Bagian dari langkah penting dalam mengelola produksi perkebunan kelapa sawit adalah pemeliharaan. Selain pengaturan bahan tanaman dan pemeliharaan tanaman, pemanenan adalah bagian penting dari menggali produksi. Produksi tanaman akan ditingkatkan dengan keberhasilan panen, sementara itu pemanenan yang kurang baik akan menghambat tercapainya peningkatan produktivitas. Pemanenan mencakup semua proses mulai dari pemotongan tandan dari pohon hingga pengangkutannya ke pabrik. Setelah panen, tandan buah yang sudah matang dipotong, pelepah dipotong, brondolan dikumpulkan, dan hasil diangkut ke Tempat Pengumpul Hasil (TPH) dan kemudian dikirim ke pabrik. Setelah tanaman berumur 30 bulan, status kelapa sawit biasanya beralih dari TBM menjadi TM. Pemanen harus memahami persiapan panen, standar matang, rotasi panen, sistem panen, dan sarana panen.

### **2.1.6 Teori Produksi**

Produksi merupakan hasil dari suatu proses kegiatan yang memanfaatkan input dengan mengkombinasikan berbagai input untuk menghasilkan output (Mustari et al., 2020). Teori produksi adalah studi tentang bagaimana menggunakan kombinasi input atau faktor produksi dapat digunakan untuk mencapai output yang optimal. Teori produksi adalah suatu kajian tentang bagaimana penggunaan input yang tersedia oleh produsen untuk mencapai tujuannya. Proses pencampuran banyak input untuk menghasilkan barang dan jasa yang disebut produksi (Alamri et al., 2022).

Menurut Karmini (2018), bahwa produksi adalah proses pemanfaatan atau pengalokasian faktor produksi yang ditujukan untuk meningkatkan kegunaannya, atau proses untuk menghasilkan barang dan atau jasa untuk pemenuhan kebutuhan manusia.

Menurut Debertin (2012) teori produksi terdiri atas dua bahagian yaitu teori produksi dengan satu input variabel dan teori produksi dengan dua atau lebih input variabel. Secara umum, fungsi produksi ditulis sebagai berikut:

$$Y = f(X) \dots \dots \dots (2.1)$$

Keterangan :

Y = Output (hasil produksi)

X = Input (faktor produksi)

Sebahagian besar proses produksi yang terjadi membutuhkan beberapa faktor produksi, oleh karena fungsi produksi dapat dituliskan menjadi:

$$Y = f(X_1, X_2, X_3, X_4, X_5, \dots, \dots X_n) \dots \dots \dots (2.2)$$

Keterangan :

Y = Hasil produksi atau jumlah produk yang dihasilkan (output), yang merupakan variabel yang dipengaruhi oleh X.

X = Faktor produksi atau Jumlah penggunaan faktor produksi utama (input), yang merupakan variabel yang mempengaruhi Y.

Law of deminishing return atau hukum hasil marginal yang semakin menurun merupakan teori dalam ekonomi yang menduga bahwa adanya peningkatan penggunaan suatu input ataupun lebih dengan asumsi input lain tetap akan menyebabkan penambahan output yang lebih rendah setelah kapasitas optimum tercapai. Peningkatan input variabel yang ditambahkan ke input tetap akan membentuk perubahan pada input dan variabel. Hukum marjinal yang semakin berkurang disebut dengan hukum proporsi variabel. Menurut hukum hasil marginal yang semakin berkurang, penambahan input tambahan akan menghasilkan penambahan ouput yang semakin sedikit dari totalnya. Fungsi produksi harus memiliki kemiringan negatif agar hukum hasil yang berkurang mengacu pada peningkatan perubahan fungsi produksi yang disebut kelengkungan fungsi produksi (Debertin, 2012). Kurva Law of Deminishing Return dapat digambarkan seperti pada Gambar 1.

Gambar 1. Kurva Law Diminishing Return

Sumber: Debertin, (2012)

Gambar 1 menunjukkan penggunaan input  $X_1$  meningkat, produktivitas input juga akan meningkat, dengan demikian fungsi *Marginal Physical Production* (MPP) juga mengalami peningkatan. Titik belok menandai produk marjinal mengalami perubahan dari bertambah menjadi mengalami penurunan. Fungsi *Total Physical Production* (TPP) bergerak cembung ke arah sumbu horizontal sebelum titik belok dan menjadi cekung ke sumbu horizontal setelah melewati titik belok. Titik belok merupakan hasil akhir dari peningkatan produk marjinal dan mulainya penurunan produk marjinal.

Fungsi MPP tersebut mencapai titik maksimumnya dan bergerak menuju nilai 0. Setelah itu MPP berada di bawah nilai 0, sehingga menambah input  $X_1$  akan menurunkan TPP (Debertin, 2012).

Saat penggunaan input  $X_1$  meningkat dan produk marginal juga meningkat, maka fungsi MPP akan mengalami perubahan yaitu mengalami peningkatan. Titik belok menandai produk marginal maksimum dan penambahan produktivitas input  $X_1$  yang paling besar. Ketika titik belok pada produk marginal  $X_1$  menurun maka fungsi MPP juga akan menurun. Produk marginal  $X_1$  adalah nol dan berada pada titik maksimal output dan akan bernilai negatif setelah melewati titik maksimal output. Fungsi MPP berada pada nol di titik maksimal output dan negatif setelahnya. Produk fisik rata-rata (*Average Physical Production* atau APP) juga berubah ketika meningkatnya penggunaan  $X_1$  dimana dalam hal ini APP tidak pernah bernilai negatif. Seperti yang ditunjukkan sebelumnya, APP adalah rasio output terhadap input, dalam hal ini  $Y/X_1$  atau  $TPP/X_1$ . Karena APP merupakan titik yang dipilih pada fungsi produksi yang dapat diilustrasikan dengan menggambar sebuah garis dari titik asal grafik ke titik yang dipilih. Kemiringan garis ini adalah  $Y/X_1$  dan sesuai dengan nilai  $Y$  dan  $X_1$  untuk fungsi produksi. Jika titik yang dipilih pada fungsi tersebut adalah nilai  $X_1$  maka disebut  $X_1^*$ , maka APP pada  $X_1^*$  adalah  $Y/X^*$  (Debertin, 2012).

Pada titik  $X_1^*$  di mana  $Y/X = dY/dX$ . Pada titik manapun yang kurang dari  $X_1^*$ , kemiringan dari fungsi produksi lebih besar dari kemiringan garis yang ditarik dari titik asal ke titik tersebut. Oleh karena itu, APP harus lebih kecil dari MPP sebelum  $X_1^*$ . Dengan meningkatnya penggunaan  $X_1$  menuju  $X_1^*$  maka APP meningkat, sehingga kemiringan fungsi produksi lebih kecil dari kemiringan garis yang ditarik dari titik asal ke titik tersebut. Oleh karena itu, MPP harus berkurang dari APP setelah  $X_1$ . Ketika penggunaan  $X_1$  meningkat melebihi  $X_1^*$ , kemiringan garis yang ditarik dari titik asal akan menurun maka APP juga menurun. Kemiringan dari garis tersebut tidak menjadi negatif maka APP tidak negatif. Namun, garis yang bersinggungan dengan fungsi produksi atau MPP akan berada pada kemiringan negatif di luar titik maksimalisasi output (Debertin, 2012).

Gambar 1 juga mengilustrasikan hubungan antara APP dan fungsi MPP untuk

fungsi produksi neoklasik. Fungsi MPP akan meningkat seiring dengan meningkatnya penggunaan input, hingga titik belok dari fungsi produksi mencapai titik A dan fungsi MPP mencapai maksimum. Setelah itu, MPP akan menurun jika mencapai nilai nol ketika output mencapai maksimum di titik C, dan kemudian menjadi negatif. Fungsi APP meningkat setelah melewati titik belok dari fungsi produksi sampai mencapai fungsi MPP di titik B. Setelah di titik B, APP akan menurun tetapi tidak menjadi negatif (Debertin, 2012).

Pada teori produksi terdapat tiga skala produksi yaitu *increasing return to scale (IRS)*, *constant return to scale (CRS)* dan *decreasing return to scale (DRS)*. *Return to scale* dapat dilihat dari penambahan koefisien regresi dari faktor produksi. *Increasing return to scale* terjadi ketika peningkatan output lebih dari dua kali lipat ketika seluruh input ditambahkan dua kali lipat, maka dikatakan terjadi peningkatan skala hasil. Peluang *increasing return to scale* secara ekonomi lebih menguntungkan jika menjalankan satu usaha besar dengan biaya produksi yang relatif rendah, dibandingkan mempunyai banyak usaha kecil namun biayanya relatif tinggi. Sederhananya, ketika *increasing return to scale* maka persentase perubahan output lebih tinggi daripada persentase perubahan input. yaitu dari titik  $X = 0$  hingga mencapai nilai maksimal (MP) atau  $EP > 1$ .

*Constant return to scale* terjadi ketika input produksi ditambah dua kali lipat maka ada penambahan pada output juga sejumlah dua kali lipat. Pada *constant return to scale*, sebuah pabrik akan dengan mudah direplikasi menjadi dua pabrik yang memproduksi output dua kali lebih banyak. Pada *constant return to scale* persentase perubahan output sebagaimana persentase perubahan inputnya dan terjadi pada perusahaan-perusahaan dengan skala usaha besar yang kesusahan dalam mengatur dan menjalankan usahanya dapat menyebabkan penurunan produktivitas tenaga kerja dan modal. Dapat disimpulkan, pada *constant return to scale* persentase perubahan output lebih kecil dari persentase perubahan input dari MP maksimum sampai  $MP = APP$  atau  $EP = 1$ .

*Decreasing return to scale* terjadi ketika peningkatan output yang dihasilkan mungkin saja kurang dari dua kali lipat walaupun input sudah ditingkatkan dua kali lipat, yaitu dari titik MP mulai negatif sampai seterusnya atau  $EP < 0$ .

Mungkin produsen akan mampu menghasilkan output yang maksimal. Ketika produsen menghasilkan output maksimal maka elastisitas produksi sama dengan 0. Elastisitas produksi sama dengan 0 artinya jika produsen menambah input lebih dari 0 maka tambahan outputnya adalah 0. Jumlah yang dapat diproduksi oleh seorang produsen bisa jadi semakin berkurang (jumlah produksi semakin berkurang dari output maksimalnya). Ketika output menurun, elastisitas produksi menjadi negatif. Elastisitas produksinya negatif artinya meskipun produsen menambah input lebih besar dari 0, maka menyebabkan tambahan produksi lebih kecil dari 0.

### 2.1.7. Faktor Produksi Usahatani

Semua pengorbanan dalam produksi disebut faktor produksi oleh karena faktor produksi tersebut digunakan untuk menghasilkan output. Faktor produksi adalah input yang digunakan untuk menghasilkan produk, sehingga terdapat hubungan yang langsung antara input yang digunakan dan output yang dihasilkan. Faktor produksi juga menentukan seberapa besar atau kecil produksi yang dihasilkan (Kilo et.al., 2018).

Secara ekonomis, proses pendayagunaan sumber daya dapat dikelola dengan baik untuk mendapatkan hasil yang terjamin dari segi kualitas dan kuantitas, yang memungkinkan komoditas untuk diperdagangkan. Faktor produksi dalam pertanian meliputi tanah (lahan) dan modal (sarana produksi). Produksi merupakan kegiatan dalam suatu proses tertentu yang dapat menghasilkan atau menambah nilai pada barang atau jasa. Produsen adalah orang yang membuat atau menghasilkan barang atau jasa baik secara sendiri maupun bersama – sama. Barang yang dihasilkan dalam waktu yang sama disebut sebagai produk. Secara umum, manufaktur merupakan perubahan bahan mentah menjadi produk jadi atau menambah nilai pada suatu produk. Hal ini dilakukan untuk memenuhi kebutuhan masyarakat (konsumen) sehari-hari (Syahidin and Erma, 2021).

Faktor produksi utama yang mempengaruhi produksi tersebut antara lain:

#### a. Lahan Pertanian

Lahan pertanian adalah faktor produksi yang penting dalam kegiatan pertanian karena lahan adalah tempat proses produksi pertanian berlangsung. Penggunaan lahan

dapat dipengaruhi oleh bagian bentang secara keseluruhan, yang meliputi lingkungan fisik seperti iklim, topografi lahan, hidrologi dan vegetasi alami yang ada. Semakin luas lahan yang diusahakan atau ditanami, semakin banyak produksi yang akan dihasilkan. Ini menunjukkan bahwa lahan pertanian adalah faktor yang berpengaruh terhadap faktor produksi komoditas pertanian. Satuan yang digunakan untuk menggambarkan luas lahan pertanian adalah hektar (ha) atau are (Mustari et al., 2020).

Hasil penelitian Yanita and Suandi, (2021) pada perkebunan kelapa sawit rakyat di Kumpeh Muaro Jambi menunjukkan bahwa lahan berpengaruh positif terhadap produksi. Hasil penelitian Adzani dan Arif, (2023) menunjukkan bahwa luas lahan berpengaruh positif terhadap produksi kelapa sawit rakyat di Kalimantan Barat. Hasil penelitian Hasibuan et al., (2022) di Hualombang Lubuk Barumon Padang Lawas menunjukkan bahwa luas lahan berpengaruh positif terhadap produksi usahatani kelapa sawit rakyat. Menurut hasil penelitian Siswanto et al., (2020) di Tebing Linggahara Bilah Barat Tebing Linggahara Bilah Barat Labuhanbatu bahwa luas lahan berpengaruh positif terhadap produksi kelapa sawit rakyat. Penelitian Chaira et al., (2022) memperlihatkan bahwa luas lahan berpengaruh yang positif terhadap produksi perkebunan kelapa sawit rakyat di Kumpeh Ulu Muaro Jambi. Selain itu, hasil penelitian Mini et al., (2023) di Benggaulu Dapurang Pasangkayu menunjukkan bahwa luas lahan berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat.

Hasil penelitian yang dilakukan oleh Arsyad and Maryam (2017) terhadap kelompok tani Sawit Mandiri di Suka Maju Kongbeng Kutai Timur menemukan bahwa luas lahan berpengaruh tidak nyata terhadap produksi perkebunan kelapa sawit rakyat. Hasil penelitian Alfayanti dan Efendi, (2013).di Mukomuko juga menunjukkan bahwa lahan tidak berpengaruh terhadap produksi perkebunan kelapa sawit rakyat.

## **b. Tenaga Kerja**

Menurut Rahma et.al., (2020), bahwa tenaga kerja adalah faktor produksi yang digunakan dalam suatu proses produksi yang harus diperhatikan karena tenaga kerja merupakan salah satu unsur yang paling menentukan bagi usahatani. Tenaga kerja memiliki pengaruh pada pertumbuhan tanaman, produktivitas dan kualitas produk. Tidak hanya diperhatikan dari segi jumlah ketersediaannya melainkan dari segi efisiensi

penggunaannya. Tenaga kerja yang secara menyeluruh memiliki peran dalam kegiatan usaha pertanian yaitu berupa tenaga kerja yang berasal dari keluarga dan tenaga kerja yang bersal dari luar keluarga petani. Peran tenaga kerja digunakan dalam menghasilkan produksi pertanian yang sebesar-besarnya serta menjalankan proses kerja secara intensif dalam waktu kerjanya (Manggala and Boedi, 2018).

Penelitian yang dilakukan oleh Arsyad and Maryam (2017) memperlihatkan bahwa tenaga kerja berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat pada kelompok tani Sawit Mandiri di Suka Maju Kongbeng Kutai Timur. Hasil peneltian Heriyanto et.al., (2018) memperlihatkan bahwa tenaga kerja berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat di Indragiri Hilir Riau. Penelitian Hasibuan et.al., (2022) memperlihatkan bahwa tenaga kerja berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat di Hotalombang Lubuk Barumon Padang Lawas. Hasil peneitian Chaira et.al., (2022) menunjukkan bahwa tenaga kerja berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat di Kumpeh Ulu Muaro Jambi. Tenaga kerja berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat di Tebing Linggahara Bilah Barat Labuhanbatu (Siswanto et.al., 2020).

Hasil penelitian Yanita and Suandi (2021) di Kumpeh Muaro Jambi menunjukkan bahwa tenaga kerja tidak berpengaruh terhadap produksi perkebunan kelapa sawit rakyat. Hasil penelitian Adzani and Arif (2023) memperlihatkan bahwa tenaga kerja tidak berpengaruh terhadap produksi perkebunan kelapa sawit rakyat di Kalimantan Barat. Tenaga kerja tidak berpengaruh terhadap produksi perkebunan usahatani kelapa sawit di Benggaulu Dapurang Pasangkayu (Mini et.al., 2023).

### **c. Pupuk**

Pupuk merupakan unsur yang diberikan ke dalam tanah dengan jumlah dan dosis yang sesuai dengan tingkat kesuburan tanah dan kebutuhan tanaman sebagai penunjang pertumbuhan tanaman agar mencapai produktivitas yang lebih baik. Pupuk juga akan mempengaruhi hasil usahatani. Pupuk terdiri dari dua jenis, yaitu pupuk organik dan anorganik. Petani bervariasi dalam jenis dan dosis pupuk yang mereka gunakan, tergantung pada pengalaman dan keuangan mereka, tetapi keduanya memiliki jenis yang

sama (Rahma et al., 2020).

Penelitian pada kelompok tani sawit mandiri di Suka Maju Kongbeng Kutai Timur yang dilakukan oleh Arsyad and Maryam (2017) memperlihatkan bahwa pupuk berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat. Hasil penelitian Yanita and Suandi (2021) di Kumpeh Muaro Jambi menunjukkan bahwa pupuk berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat. Penelitian yang dilakukan Hasibuan et.al., (2022) menunjukkan bahwa pupuk berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat di Hotalombang Lubuk Barumon Padang Lawas. Hasil penelitian Chaira et al., (2022) menunjukkan bahwa pupuk berpengaruh positif terhadap produksi usahatani kelapa sawit rakyat di Kumpeh Ulu Muaro Jambi. Hasil penelitian Siswanto et al., (2020) menunjukkan bahwa pupuk berpengaruh positif terhadap produksi kelapa sawit rakyat di Tebing Linggahara Bilah Barat Labuhanbatu. Hasil Penelitian Mini et.al., (2023) menunjukkan bahwa pupuk berpengaruh positif terhadap produksi usahatani kelapa sawit di Benggaulu Dapurang Pasangkayu.

Menurut hasil penelitian Siagian et.al., (2018) di Pematang Bandar Simalungun memperlihatkan bahwa produksi kelapa sawit rakyat tidak dipengaruhi oleh pupuk. Begitu juga dengan penelitian di Mamuju Utara yang memperlihatkan bahwa pupuk tidak berpengaruh terhadap produksi perkebunan kelapa sawit rakyat (Puruhito et.al., 2019).

#### **d. Pestisida**

Pestisida merupakan racun yang mengandung zat-zat kimia aktif yang digunakan petani dalam upaya pengendalian dan membasmi hama dan penyakit tanaman. Penggunaan pestisida dapat disesuaikan dengan kondisi tanaman serta dapat mempermudah pekerjaan petani dalam kegiatan pemberantasan gulma dan hama penyakit sehingga waktu yang digunakan lebih cepat. Penggunaan pestisida dapat menjaga hasil produksi tanaman (Rahma et al., 2020).

Penelitian yang dilakukan Arsyad and Maryam (2017) memperlihatkan bahwa herbisida berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat pada kelompok tani Sawit Mandiri di Suka Maju Kongbeng Kutai Timur. Hasil penelitian

Mustari et al., (2020) di Aceh Tamiang. menunjukkan bahwa herbisida berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat dengan pola swadaya. Penelitian yang dilakukan oleh Yanita and Suandi (2021) di Kumpeh Muaro Jambi. menunjukkan bahwa pestisida berpengaruh positif terhadap produksi perkebunan kelapa sawit rakyat. Hal yang sama, pestisida yang digunakan berpengaruh positif terhadap produksi usahatani perkebunan kelapa sawit rakyat di Kumpeh Ulu Muaro Jambi (Chaira et.al., 2022).

Hasil penelitian Ariyanto et.al., (2017) memperlihatkan bahwa herbisida tidak berpengaruh terhadap produksi perkebunan kelapa sawit pola swadaya di Kampar Riau. Penelitian yang dilakukan oleh Hasibuan et.al., (2022) di Hutalombang Lubuk Barumun Padang Lawas menunjukkan bahwa herbisida tidak berpengaruh terhadap produksi perkebunan kelapa sawit rakyat. Herbisida tidak berpengaruh terhadap produksi perkebunan kelapa sawit rakyat di Mamuju Utara (Puruhito et.al., 2019).

#### **e. Manajemen**

Manajemen dapat diartikan sebagai upaya merencanakan, mengorganisasikan dan melaksanakan serta mengevaluasi suatu proses produksi. Dalam proses produksi pasti akan melibatkan sejumlah tenaga kerja dari berbagai kedudukan sehingga diperlukan adanya manajemen untuk mengelola tenaga kerja tersebut dalam tahapan proses produksi. Manajemen dapat tergolong dalam berbagai aspek seperti tingkat pendidikan, tingkat keterampilan, skala usaha serta besar kecilnya kredit dan macam komoditas (Mustari et.al., 2020).

#### **2.1.8 Produktivitas**

Produktivitas adalah istilah yang digunakan untuk membandingkan output (keluaran) dan input (masukan) dalam kegiatan produksi. Produktivitas merupakan ukuran seberapa baik sumber daya dikelola dan dimanfaatkan untuk mencapai hasil yang optimal. Produktivitas dapat dijadikan sebagai tolak ukur keberhasilan suatu industri dalam menghasilkan barang dan jasa. Oleh karena itu, semakin tinggi rasionya maka semakin tinggi pula kualitas produk yang dihasilkan. Ukuran produktivitas bervariasi tergantung pada aspek output dan input mana yang digunakan sebagai agregat dasar, misalnya indeks produktivitas tenaga kerja, produktivitas biaya langsung, produktivitas

biaya total, produktivitas energi dan produktivitas bahan baku. Produktivitas adalah ukuran yang digunakan untuk mengukur seberapa banyak produksi (output) yang dihasilkan dengan penggunaan satuan faktor produksi (input) yang digunakan (Hasibuan, 2020).

Produktivitas dan efisiensi mempunyai keterkaitan, dengan kata lain peningkatan produktivitas disertai dengan perubahan efisiensi dan peningkatan efisiensi juga meningkatkan produktivitas. Petani harus dapat menggunakan faktor faktor produksi yang dikuasainya secara efisien sehingga dapat memperoleh produktivitas yang maksimal. Sementara efisiensi adalah konsep relatif yang dapat diukur dengan membandingkan rasio output dan input aktual dengan rasio output dan input optimal, produktivitas adalah konsep mutlak yang dapat diukur dengan rasio output dan input (Manik, 2022).

### 2.1.9 Efisiensi

Efisiensi adalah konsep ekonomi yang terkait dengan kelangkaan sumber daya yang tersedia sehingga penggunaannya secara alternatif. Efisiensi dikaitkan dengan aktivitas produktif yang menggabungkan input atau sumber daya dan output atau produksi. Efisiensi dalam arti luas mengacu pada efisiensi produksi yang dinyatakan pada hubungan input atau sumber daya ekonomi yang dinyatakan dalam satuan fisik moneter, dengan output yang dinyatakan sebagai hasil keuangan perusahaan, baik dalam satuan fisik dan nilai moneter (baik pendapatan, biaya, manfaat dan lainnya). Selanjutnya indeks efisiensi merupakan indeks relatif di mana perusahaan atau unit pengambilan keputusan kurang atau lebih efisien menurut sampel perusahaan yang dianalisis (Alberca and Parte, 2020).

Jika efisiensi teknis merupakan konsep yang berfokus pada input yang relatif terhadap tingkat output yaitu dengan meminimalkan input maka output yang dihasilkan memiliki kuantitas yang sama maka efisiensi ekonomi merupakan konsep yang lebih luas dari efisiensi teknis di mana efisiensi ekonomi harus memilih tingkat campuran antara input dengan output untuk mengoptimalkan ekonomi dengan meminimalisasi biaya dan memaksimalkan keuntungan (Bauer et.al., 1998)

Efisiensi produksi adalah metode yang digunakan untuk membandingkan kinerja suatu perusahaan yang diamati dengan beberapa standar efisiensi sempurna yang telah ditetapkan atau perbandingan antara output maksimal dengan input yang tersedia. Ukuran sederhana efisiensi perusahaan yang dapat yang dapat memperhitungkan berbagai input. Farrel (1957) mengusulkan bahwa efisiensi terdiri atas efisiensi teknis dan efisiensi alokatif. Konsep efisiensi teknis mencerminkan kemampuan yang dimiliki petani dalam memperoleh output maksimal dari sejumlah input yang diberikan, dan efisiensi alokatif mencerminkan kemampuan yang dimiliki petani dalam penggunaan input secara proporsional sesuai dengan masing-masing harga dan metode berproduksi yang digunakan. Efisiensi ekonomi adalah hasil dari kombinasi kedua jenis efisiensi tersebut. Perhitungan efisiensi dapat dilakukan dengan dua metode, yaitu pendekatan input dan pendekatan output. Pengukuran efisiensi difokuskan pada penggunaan input. Pendekatan input memerlukan data harga input dan kurva isokuantitas yang tersedia yang memperlihatkan perpaduan dari input yang digunakan sehingga akan mencapai output maksimal (Coelli et.al., 2005).

Sebelumnya, Farrel (1957) telah membuat ilustrasi efisiensi teknis dan efisiensi alokatif seperti dapat dilihat pada Gambar 2 berikut ini.

Gambar 2 : Kurva Efisiensi Teknis dan Efisiensi Alokatif

Sumber : Farrel (1957)

Pada Gambar 2 Farrel mengilustrasikan idenya dengan menggunakan contoh sederhana di mana perusahaan yang menggunakan dua input ( $X_1$  dan  $X_2$ ) untuk menghasilkan satu output ( $Y$ ) dengan asumsi skala pengembalian yang konstan. Pengetahuan satuan isoquant yang sepenuhnya efisien ditunjukkan  $SS'$  pada gambar diatas di mana titik  $P$  menunjukkan input dari dua faktor yaitu output ( $X_1/Y$  dan  $X_2/Y$ ) dan  $SS'$  merupakan kombinasi kedua yang faktor yang digunakan dalam menghasilkan ouput secara efisien dan titik  $Q$  berada pada kurva isoquant  $SS'$ . Titik  $Q$  dan titik  $P$  menggunakan faktor yang sama, di mana  $Q$  hanya membutuhkan penggunaan input sebanyak  $OQ/OP$  dan menghasilkan ouput  $OP/OQ$  yang lebih banyak dari input yang sama. dapat disimpulkan  $OQ/OP$  merupakan efisiensi teknis dari perusahaan  $P$ . Garis  $AA'$  merupakan perbandingan antara harga dan faktor input dari titi  $Q$ . Pada titik  $Q$  menunjukkan adanya perpotongan antara kurva isoquant  $SS'$  dengan kurva isocost  $AA'$ . Ini menjelaskan bahwa perusahaan tersebut bisa saja efisien secara teknis, namun tidak efisien dari segi biaya input. Maka produksi  $OR/OQ$  harus dikurangi dari biaya produksi di  $Q$ . Sehingga dengan efisiensi alokatif dapat menghasilkan jumlah output pada isoquant dengan biaya yang minimum. Efisiensi alokatif dapat dihitung jika garis  $AA$  menyinggung kurva isoquant  $SS$  pada titik  $Q$ , yang dapat dihitung dengan rasio  $OR/OQ$ .

Jarak antara RQ menunjukkan biaya yang diminimumkan untuk mencapai efisiensi alokatif. Kedua efisiensi teknis dan alokatif berada di titik Q, sehingga perkalian antara efisiensi teknis dan alokatif adalah efisiensi ekonomi (Farrel, 1957).

Dengan demikian, dikenal tiga jenis efisiensi yaitu efisiensi teknis, efisiensi harga (efisiensi alokatif) dan efisiensi ekonomi. Menurut Chotimah, (2019), ketiga jenis efisiensi tersebut dapat dijelaskan sebagai berikut :

- a) Efisiensi teknis, yaitu besaran yang memperlihatkan perbandingan antara produksi sebenarnya dengan produksi maksimum. Efisiensi teknis akan tercapai bila petani mampu mengalokasikan faktor produksi sedemikian rupa sehingga hasil yang tinggi dapat dicapai.
- b) Efisiensi alokatif (efisiensi harga) adalah besaran yang menggambarkan kemampuan suatu unit usaha dalam penggunaan input dalam proporsi yang optimal, sesuai dengan harganya masing-masing dan teknologi produksi. Efisiensi alokatif merupakan rasio antara total biaya produksi suatu output menggunakan faktor aktual dengan total biaya produksi suatu output menggunakan faktor optimal dengan kondisi efisien secara teknis.
- c) Efisiensi ekonomi, adalah besaran yang menunjukkan suatu keadaan ketika petani melakukan peningkatan kinerjanya dengan menekan harga dari faktor produksi dan menjual hasil produksinya dengan harga yang tinggi. Sehingga dapat dikatakan, bahwa ketika petani melakukan efisiensi ekonomi maka sekaligus juga telah melakukan efisiensi teknis dan efisiensi harga. Konsep yang digunakan dalam efisiensi ekonomi adalah meminimalkan biaya artinya suatu proses produksi akan efisien secara ekonomi pada suatu tingkat output jika tidak ada proses lain yang dapat menghasilkan output yang sama dengan biaya yang lebih rendah.

#### **2.1.10. Faktor Yang Berpengaruh Terhadap Efisiensi Produksi**

Efisiensi produksi usahatani (*farm efficiency*) dipengaruhi oleh banyak faktor. Van Passel et al., (2007) menjelaskan bahwa efisiensi produksi usahatani dipengaruhi oleh faktor yaitu:

- a) *Agent factors* atau faktor perantara yang terdiri dari pendidikan petani, umur petani,

pengalaman bertani dan lain-lain.

b) *Structural factors* atau faktor struktural berupa:

- 1) *On farm factors* atau faktor internal usahatani di antaranya lokasi usahatani, tipe usahatani, ukuran usahatani dan lain-lain.
- 2) *Off farm factors* atau faktor di luar usahatani di antaranya hubungan organisasi usahatani (up-down stream relation), kebijakan dan lain-lain.

Beberapa penelitian tentang faktor produksi penunjang yang mempengaruhi efisiensi produksi usahatani yang telah dilakukan sebelumnya dapat dijelaskan berikut ini.

## 1. Jenis Kelamin

Hasil penelitian Danso-Abbeam et.al., (2020) menunjukkan bahwa jenis kelamin memiliki pengaruh positif yang nyata terhadap efisiensi teknis pertanian kakao di Ghana. Penelitian pada usahatani kakao di Indonesia yang dilakukan Effendy et.al., (2019) menunjukkan bahwa efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif jenis kelamin dipengaruhi secara positif oleh jenis kelamin. Penelitian Asfaw (2019) pada usahatani gandum di Ethiopia Barat juga menunjukkan bahwa efisiensi ekonomi dipengaruhi secara positif oleh jenis kelamin petani.

Efisiensi teknis perkebunan kelapa sawit rakyat tidak dipengaruhi jenis kelamin petani, diperlihatkan oleh penelitian Simatupang et.al., (2024) di Besitang Langkat serta penelitian yang dilakukan oleh Obi and Ayodeji (2020) pada usahatani jagung rakyat di Afrika Selatan. Sementara itu, hasil penelitian Mengui et.al., (2019) memperlihatkan bahwa jenis kelamin berpengaruh negatif pada efisiensi teknis pada usahatani kentang di Kamerun.

## 2. Umur

Hasil penelitian Varina et al., (2020) pada perkebunan kelapa sawit di Indonesia, Bankole et.al., (2018) pada perkebunan kelapa sawit rakyat di Nigeria, Ngaissset and Jia, (2020) pada perkebunan kelapa sawit rakyat di Afrika Tengah memperlihatkan bahwa umur petani berpengaruh positif terhadap efisiensi teknis. Efisiensi teknis tidak dipengaruhi oleh umur petani diperlihatkan oleh penelitian Syuhada et.al., (2022) pada perkebunan kelapa sawit di Pasaman Barat serta penelitian Ariyanto et.al., (2020) pada

perkebunan kelapa sawit rakyat di Riau dan Kalimantan Barat.

Hasil penelitian Asfaw (2019) pada usahatani gandum di Ethiopia Barat memperlihatkan bahwa umur petani berpengaruh positif terhadap efisiensi ekonomi dan efisiensi alokatif, tetapi tidak berpengaruh terhadap efisiensi teknis. Hal penelitian Rosdiantini (2020) memperlihatkan bahwa umur petani berpengaruh positif terhadap efisiensi ekonomi usahatani bawang merah di Bantul. Hasil penelitian Haile (2015) pada usahatani bawang bombay di Ethiopia memperlihatkan bahwa umur petani berpengaruh negatif terhadap efisiensi ekonomi, tetapi tidak berpengaruh terhadap efisiensi alokatif. Penelitian yang dilakukan Teferra et.al., (2018) pada usahatani di Ethiopia, penelitian Iskandar (2022) pada usahatani padi model corporate farming di Jawa Tengah, penelitian Imran et.al., (2019) pada perkebunan kapas di Punjab Pakistan, dan hasil penelitian Chebil et.al., (2015) pada usahatani gandum di Tunisia semuanya memperlihatkan bahwa umur petani tidak berpengaruh terhadap efisiensi ekonomi, tetapi berpengaruh positif terhadap efisiensi alokatif. Hasil penelitian Teferra et.al., (2018) pada usahatani di Ethiopia memperlihatkan bahwa umur tidak berpengaruh terhadap efisiensi alokatif.

### 3. Pendidikan

Beberapa penelitian menunjukkan bahwa pendidikan berpengaruh positif terhadap efisiensi teknis, yaitu penelitian Tenaye (2020) pada pertanian rakyat di Nigeria, Simatupang et.al., (2024) pada perkebunan kelapa sawit rakyat di Besitang Langkat, Varina et.al., (2020) pada perkebunan kelapa sawit rakyat di Indonesia, Abdul et.al., (2022) pada perkebunan kelapa sawit rakyat di Indonesia dan Ariyanto et.al., (2020) pada perkebunan kelapa sawit rakyat di Riau dan Kalimantan Barat serta Alwarritzi et.al., (2015) pada perkebunan kelapa sawit rakyat di Indonesia. Hasil yang diperoleh penelitian ini tidak sejalan dengan hasil penelitian Imran et.al., (2019) pada perkebunan kapas di Punjab Pakistan yang memperlihatkan bahwa pendidikan petani tidak berpengaruh terhadap efisiensi teknis. Begitu juga hasil penelitian Syuhada et.al., (2022) pada usahatani kelapa sawit di Pasaman Barat dan Ngaisset and Jia (2020) pada perkebunan kelapa sawit di Afrika Tengah memperlihatkan hasil yang sama. Terdapat beberapa penelitian yang menunjukkan bahwa pendidikan petani tidak berpengaruh terhadap

efisiensi teknis, yaitu penelitian Imran et.al., (2019) pada perkebunan kapas di Punjab Pakistan, Syuhada et.al., (2022) pada perkebunan kelapa sawit di Pasaman Barat dan penelitian Ngaissset and Jia (2020) pada perkebunan kelapa sawit di Afrika Tengah.

Hasil penelitian Teferra et.al., (2018) pada usahatani di Ethiopia memperlihatkan bahwa pendidikan petani berpengaruh positif terhadap efisiensi ekonomi, demikian juga yang ditunjukkan oleh hasil penelitian Asfaw (2019) pada usahatani gandum di Ethiopia Barat dan penelitian Iskandar (2022) pada usahatani padi model corporate farming di Jawa Tengah. Hal yang tidak sejalan ditunjukkan oleh hasil penelitian pada usahatani bawang merah di Bantul yang dilakukan Rosdiantini (2020), hasil penelitian Chebil et.al., (2015) pada usahatani gandum di Tunisia dan hasil penelitian Haile (2015) pada usahatani bawang bombay di Ethiopia yang memperlihatkan bahwa pendidikan petani tidak berpengaruh terhadap efisiensi ekonomi. Hasil penelitian Obi and Ayodeji (2020) pada usahatani jagung rakyat di Afrika Selatan memperlihatkan bahwa pendidikan petani berpengaruh negatif terhadap efisiensi ekonomi.

Hasil penelitian Asfaw (2019) pada usahatani gandum di Ethiopia Barat menunjukkan bahwa efisiensi alokatif dipengaruhi secara positif oleh pendidikan petani. Hasil penelitian Chebil et al., (2015) pada usahatani gandum di Tunisia, penelitian Berhan, (2015) pada usahatani bawang bombay di Ethiopia dan penelitian Teferra et.al., (2018) pada usahatani di Ethiopia memperlihatkan bahwa pendidikan tidak berpengaruh terhadap efisiensi alokatif. Sementara itu, hasil penelitian Obi and Ayodeji (2020) pada usahatani jagung rakyat di Afrika Selatan menunjukkan bahwa efisiensi alokatif dipengaruhi secara negatif oleh pendidikan petani.

#### **4. Pengalaman Bertani**

Pengalaman bertani berpengaruh positif terhadap efisiensi teknis sebagaimana yang diperlihatkan hasil penelitian pada perkebunan kelapa sawit rakyat di Kabupaten Muaro Jambi (Damayanti et.al., 2023). Hal yang sama diperlihatkan hasil penelitian pada perkebunan kelapa sawit rakyat di Besitang Langkat oleh Simatupang et al., (2024), hasil penelitian Abdul et.al., (2022) pada perkebunan kelapa sawit rakyat di Indonesia dan hasil penelitian Syuhada et.al., (2022) pada perkebunan kelapa sawit di Pasaman Barat. Hasil penelitian pada perkebunan kelapa sawit rakyat di Ogan Komering Hilir

Fariani et al., (2019) dan penelitian Bankole et.al., (2018) pada perkebunan kelapa sawit rakyat di Nigeria menunjukkan bahwa efisiensi teknis tidak dipengaruhi pengalaman bertani.

Hasil penelitian Obi and Ayodeji (2020) pada usahatani jagung rakyat di Afrika Selatan, hasil penelitian Haile (2015) pada usahatani bawang bombay di Ethiopia dan hasil penelitian yang Chebil et.al., (2015) pada usahatani gandum di Tunisia memperlihatkan bahwa efisiensi alokatif tidak dipengaruhi oleh pengalaman bertani petani.

## **5. Ukuran Keluarga**

Hasil penelitian Mabe et.al., (2018) pada usahatani padi di Ghana dan penelitian Tenaye, (2020) pada pertanian rakyat di Ethiopia memperlihatkan bahwa efisiensi teknis dipengaruhi secara positif oleh ukuran keluarga petani. Penelitian Tanko (2019) pada pertanian rakyat di Kano State Nigeria menemukan bahwa ukuran keluarga berpengaruh negatif terhadap efisiensi teknis pertanian rakyat, begitu juga dengan penelitian Ulum (2017) pada usahatani kentang di Lumajang memperlihatkan bahwa efisiensi teknis dipengaruhi secara negatif oleh ukuran keluarga, namun penelitian Simatupang et al. (2024) di Besitang Langkat memperlihatkan bahwa efisiensi teknis tidak dipengaruhi oleh ukuran keluarga petani.

Hasil penelitian pada usahatani padi dengan model corporate farming di Jawa Tengah yang dilakukan Iskandar (2022) memperlihatkan bahwa efisiensi ekonomi dipengaruhi secara negatif oleh ukuran keluarga. Hasil penelitian yang dilakukan oleh Rosdiantini (2020), memperlihatkan bahwa efisiensi ekonomi usahatani bawang merah di Bantul tidak dipengaruhi oleh jumlah anggota keluarga petani.

Hasil yang diperoleh hasil penelitian Haile (2015) pada usahatani bawang bombay di Ethiopia memperlihatkan bahwa ukuran keluarga petani tidak berpengaruh terhadap efisiensi ekonomi dan efisiensi alokatif.

## **6. Kategori Bibit**

Menurut hasil penelitian Syuhada et al. (2022) pada perkebunan kelapa sawit rakyat di Pasaman Barat memperlihatkan bahwa efisiensi teknis dipengaruhi secara positif oleh kategori bibit yang digunakan petani. Penelitian yang dilakukan oleh

Dalheimer et.al., (2021) memperlihatkan bahwa kategori bibit berpengaruh positif terhadap efisiensi teknis pada perkebunan rakyat di Indonesia, begitu juga dengan penelitian Abdul et al., (2022) pada perkebunan kelapa sawit di Indonesia. Tetapi penelitian yang dilakukan oleh Welda (2019) pada perkebunan kelapa sawit rakyat di Dharmasraya memperlihatkan bahwa efisiensi teknis dipengaruhi secara negatif oleh kategori bibit yang digunakan petani.

Menurut kesimpulan yang diperoleh dari penelitian yang dilakukan Effendy et.al., (2019) pada usahatani kakao di Indonesia bahwa kategori bibit berpengaruh positif terhadap efisiensi ekonomi dan efisiensi alokatif.

## **7. Jumlah Tanaman**

Hasil penelitian Ismiasih and Afroda (2023) pada usahatani di Kalimantan Barat, dan penelitian Welda et.al., (2020) pada usahatani kelapa sawit rakyat di Dharmasraya memperlihatkan bahwa efisiensi teknis dipengaruhi secara positif oleh jumlah tanaman produktif (Welda et.al., 2020).

Penelitian oleh Mustari et.al., (2020) pada perkebunan kelapa sawit rakyat dengan pola swadana di Aceh Tamiang memperlihatkan bahwa efisiensi teknis dipengaruhi secara negatif oleh jumlah tanaman kelapa sawit.

Hasil penelitian penelitian Chebil et.al., (2015) pada usahatani gandum di Tunisia memperlihatkan bahwa efisiensi ekonomi dan efisiensi alokatif dipengaruhi oleh jumlah tanaman.

## **8. Akses Kredit**

Beberapa penelitian yang menunjukkan hasil bahwa efisiensi teknis dipengaruhi secara positif oleh akses kredit antara lain adalah yang dilakukan Ojo and Baiyegunhi (2020) pada usahatani padi di Nigeria, penelitian Imran et.al., (2019). pada perkebunan kapas di Punjab Pakistan. Sementara itu, penelitian pada perkebunan kelapa sawit rakyat di Indonesia oleh Abdul et.al., (2022) dan penelitian Simatupang et al., (2024) di Besitang Langkat memperlihatkan bahwa efisiensi teknis tidak dipengaruhi oleh akses kredit yang dilaksanakan petani.

Hasil penelitian Effendy et.al., (2019) pada usahatani kakao di Indonesia. dan Imran et.al., (2019) pada perkebunan kapas di Punjab Pakistan menunjukkan bahwa

efisiensi ekonomi dipengaruhi secara positif oleh akses kredit yang dilaksanakan petani. Sementara itu, penelitian Teferra et.al., (2018) pada usahatani di Ethiopia, penelitian Haile (2015) pada usahatani bawang bombay di Ethiopia dan hasil penelitian Obi and Ayodeji (2020) pada usahatani jagung rakyat di Afrika Selatan memperlihatkan bahwa akses kredit tidak berpengaruh terhadap efisiensi ekonomi.

Penelitian Effendy et.al., (2019) pada usahatani kakao di Indonesia dan penelitian Teferra et.al., (2018) pada usahatani di Ethiopia memperlihatkan bahwa efisiensi alokatif dipengaruhi secara positif oleh akses kredit yang dilaksanakan petani. Hasil penelitian Haile (2015) pada usahatani bawang bombay di Ethiopia memperlihatkan bahwa akses kredit tidak berpengaruh terhadap efisiensi alokatif. Sementara itu, hasil penelitian Obi and Ayodeji (2020) pada usahatani jagung rakyat di Afrika Selatan menunjukkan bahwa efisiensi alokatif dipengaruhi secara negatif oleh akses kredit yang dilaksanakan petani.

## **9. Jarak ke Pasar Input**

Menurut hasil penelitian Martey (2019) pada usahatani jagung di Ghana dan penelitian Teferra et al., (2018) pada usahatani padi di Ethiopia bahwa jarak ke pasar berpengaruh positif terhadap efisiensi teknis. Hasil penelitian Teferra et al., (2018) memperlihatkan bahwa jarak ke pasar berpengaruh negatif pada efisiensi teknis.

Jarak ke pasar input tidak berpengaruh terhadap efisiensi ekonomi diperlihatkan oleh hasil penelitian Sibiko (2012) pada usahatani kacang di Uganda tetapi memiliki pengaruh negatif terhadap efisiensi alokatif. Sementara itu, hasil yang diperoleh Teferra et.al., (2018) pada usahatani di Ethiopia menunjukkan bahwa jarak ke pasar input berpengaruh negatif pada efisiensi ekonomi dan efisiensi alokatif.

## **10. Aplikasi Pupuk Organik**

Aplikasi pupuk organik berpengaruh positif terhadap efisiensi teknis sebagaimana diperlihatkan oleh hasil penelitian Salam et.al., (2021) pada usahatani padi di Bangladesh dan hasil penelitian yang dilakukan di Pasaman Barat oleh Syuhada et.al., (2022) memperlihatkan bahwa penggunaan pupuk organik memiliki pengaruh positif terhadap produktivitas usahatani kelapa sawit. Hasil penelitian Chau and Ahamed (2022) pada usahatani padi di Vietnam menunjukkan bahwa aplikasi pupuk organik berpengaruh negatif terhadap efisiensi teknis.

Hasil penelitian yang diperoleh Effendy et.al., (2019) pada usahatani kakao di Indonesia menunjukkan bahwa pupuk organik berpengaruh positif terhadap efisiensi ekonomi dan efisiensi alokatif.

## 11. Organisasi Petani

Hasil penelitian yang dilakukan pada perkebunan kelapa sawit rakyat sawit di Keerom Papua oleh Huwae et. al., (2013) menunjukkan bahwa produktivitas dipengaruhi secara positif oleh pengembangan kelembagaan organisasi. Hasil penelitian Varina et.al., (2020) dan Alwarritzi et.al., (2015) pada perkebunan kelapa sawit rakyat di Indonesia memperlihatkan bahwa organisasi petani berpengaruh positif pada efisiensi teknis. Hasil penelitian Hikmasari et.al., (2013) pada usahatani mina mendong di Blayu dan Wajak, Malang menunjukkan bahwa keanggotaan organisasi pertanian tidak berpengaruh terhadap efisiensi teknis usahatani mina mendong di Blayu dan Wajak, Wajak Malang. Efisiensi teknis usahatani nanas di Subang Jawa Barat dipengaruhi secara negatif oleh keanggotaan kelompok tani (Lubis et.al., 2014).

Hasil penelitian Iskandar (2022) pada usahatani padi dengan model *corporate farming* di Jawa Tengah memperlihatkan bahwa keaktifan petani dalam kelompok tani berpengaruh positif terhadap efisiensi ekonomi.

Hasil penelitian Effendy et.al., (2019) pada usahatani kakao di Indonesia menunjukkan bahwa pengalaman mengaplikasikan pupuk organik petani berpengaruh positif terhadap efisiensi alokatif.

## 12. Penggunaan Sarana Informasi dan Teknologi

Menurut hasil penelitian Safitri et.al., (2021), bahwa penggunaan media sosial oleh petani berdampak positif pada peningkatan akurasi, efisiensi dan efektifitas penyuluhan, menjadi media pembelajaran dan sharing informasi serta peningkatan produktivitas pertanian di Tiumbang Dharmasraya. Hasil penelitian Darmayanti et.al., (2022) menunjukkan bahwa semakin sering/lama petani menggunakan smartphone akan semakin meningkat literasi media mereka, dan akan menganggap smartphone mudah untuk digunakan oleh petani kelapa sawit rakyat di Kuantan Singingi Riau. Hasil yang diperoleh Effendy et.al., (2019) pada penelitian usahatani kakao di Indonesia

menunjukkan bahwa pengalaman mengaplikasikan pupuk organik petani memiliki pengaruh positif terhadap efisiensi alokatif.

### 2.1.11. Metode Pengukuran Efisiensi

Efisiensi adalah kemampuan mengubah sumberdaya yang dimiliki menjadi suatu barang yang memiliki nilai tambah (Fisher, 1976) dalam Yusuf et al., (2021). Efisiensi dibagi dalam tiga konsep yaitu efisiensi teknis, efisiensi alokatif dan efisiensi ekonomi. Kemampuan suatu unit produksi untuk menghasilkan output maksimum dari sejumlah input yang digunakan dalam proses produksi disebut efisiensi teknis, sedangkan kemampuan suatu unit produksi untuk menggunakan input dengan cara yang meminimalkan biaya produksi berdasarkan harga input disebut efisiensi alokatif. Sementara itu, efisiensi ekonomi merupakan gabungan dari efisiensi teknis dan efisiensi alokatif (Godínez-Reyes et.al., 2021). Pendekatan untuk memperkirakan indeks efisiensi ada dua, yaitu parametrik dan non parametrik. *Stochastic Frontier Analysis* (SFA) adalah metode parametrik yang sering digunakan dan metode non parametrik dilakukan dengan menggunakan *Data Envelopment Analysis* disingkat DEA (Bidzakin et.al., 2020).

*Stochastic Frontier Analysis* (SFA) merupakan metode pengukuran parametrik yang bersifat stokastik yang digunakan dalam mengestimasi batas produksi (*frontier*) dan juga mengukur tingkat efisiensi produksi. *Stochastic Frontier Analysis* (SFA) menggunakan pendekatan ekonometrik yang di dalamnya memerlukan fungsi biaya, produksi atau profit yang mana di dalamnya menghubungkan antara input, output beserta dengan faktor-faktor yang berpengaruh dan memungkinkan untuk kesalahan acak (Sakouvogui, 2020).

Kelebihan pertama dari *Stochastic Frontier Analysis* (SFA) adalah dilibatkannya *disturbance term* yang mewakili gangguan, kesalahan pengukuran dan kejutan eksogen memiliki gangguan term yang menunjukkan gangguan, kesalahan pengukuran, dan kejutan eksogen yang di luar kontrol. Kedua, variabel lingkungan lebih mudah digunakan dalam penelitian sehingga lebih mudah untuk menguji hipotesis dengan statistik dan menemukan outliers (Bidzakin et al., 2020; Yusuf et al., 2021). Kekurangan Stochastic

Frontier Analysis (SFA) adalah tidak dapat menganalisis nilai efisiensi yang memiliki lebih dari satu output atau dengan kata lain terikat pada output tunggal (Sakouovogui, 2020). Metode non parametrik menggunakan pendekatan deterministik (linear programming), yang berarti produsen yang paling efisien diidentifikasi dalam pengamatan setiap DMU (*Decision Making Unit*). Efisiensi didefinisikan sebagai rasio maksimum output tertimbang terhadap input tertimbang untuk setiap unit pengambilan keputusan atau DMU (Gordo, 2013). Metode ini untuk pertama kali disampaikan oleh Farrel (1957) dan dijelaskan secara menyeluruh oleh Charnes et.al., (1978). DEA adalah metode non-parametrik berbasis *linear programming* untuk memeriksa fungsi produksi melalui pemetaan *frontier* produksi (Ferjani, 2011).

Pendekatan ini tidak memerlukan bentuk fungsional tertentu dan tidak menerapkan pembatasan parametrik apriori pada teknologi yang mendasarinya. Selain itu, pendekatan non-parametrik dapat digunakan untuk teknologi yang melibatkan banyak input dan output. Selanjutnya, hal ini dapat digunakan untuk memperkirakan efisiensi teknis, alokatif, ekonomi, dan skala efisiensi. Sejumlah penelitian telah menganalisis efisiensi produksi menggunakan DEA, namun penelitian mengenai tanaman tahunan dan efisiensi pertanian kelapa sawit masih terbatas. *Data Envelopment Analysis* (DEA) sebagai alat evaluasi kerja suatu aktivitas produksi perusahaan pertanian yang menggunakan satu jenis atau lebih input dan menghasilkan satu jenis output atau lebih dengan penggunaan model *linier programming* untuk mengukur efisiensi. Hasil diukur dengan menghitung rasio antara input dan output, yang merupakan satuan yang dapat diwakili secara parsial sebagai ukuran efisiensi atau produktivitas (Coelli et.al., 2005). Fokus penelitian DEA adalah unit pengambilan keputusan yang juga dikenal sebagai DMU, merupakan organisasi atau entitas yang efisiensinya akan dinilai sehubungan dengan sekelompok entitas yang sejenis. Input dan output dari setiap DMU yang akan dievaluasi harus identik atau serupa. Metode DEA menggunakan pembobotan yang tetap pada input dan output setiap DMU yang dievaluasi (Olawale and Kehinde, 2020).

Kelebihan dari *Data Envelopment Analysis* (DEA) adalah bahwa DEA dapat menangani beberapa input dan beberapa output secara bersamaan tanpa perlu menentukan

bobotnya terlebih dahulu. Selain itu, tidak diperlukan spesifikasi bentuk fungsional dari fungsi produksi, yaitu hubungan input-output yang paling efisien (seperti yang dipersyaratkan dalam pendekatan SFA) (Jalilov et.al., 2019). Kelemahan *Data Envelopment Analysis* (DEA) adalah DEA tidak selalu memperkirakan unit pengambilan keputusan (DMU) yang paling efisien, DEA hanya mengukur inefisiensi relatif dari DMU. Selain itu, DEA tidak memperkirakan efektivitas sumber daya/input yang digunakan, DEA hanya mengukur efisiensi DMU saja dibandingkan dengan DMU yang paling efisien (Jalilov et al., 2019). Efisiensi merupakan konsep ekonomi yang berkaitan dengan kelangkaan sumber daya yang tersedia, sehingga rentan terhadap penggunaan alternatif. Dalam literatur sebelumnya, efisiensi dikaitkan dengan aktivitas produktif dengan menghubungkan input atau sumber daya dan output atau produksi (Alberca and Parte, 2020).

Berdasarkan asumsinya, model DEA terdiri dari dua jenis yaitu Charnes, Cooper and Rhodes (CCR-DEA) yaitu model DEA dengan asumsi CRS (constant return to scale) serta Banker, Charnes dan Cooper (BCC-DEA) adalah model DEA dengan asumsi VRS (variable return to scale). Berdasarkan orientasinya, model DEA terdiri dari model DEA yang berorientasi pada input dan model DEA yang berorientasi pada output. Model DEA yang berorientasi pada input berfokus pada pengurangan input untuk tingkat output tertentu. Sebaliknya, model DEA yang berorientasi pada output berfokus pada memaksimalkan peningkatan proporsional dalam output dengan seperangkat input yang diberikan (Simatupang and Nababan, 2023).

### 2.1.12. Regresi Tobit (*Tobit Regression*)

Regresi Tobit, yang diusulkan oleh James Tobin pada tahun 1958, adalah salah satu metode yang dapat digunakan untuk melihat bagaimana faktor produksi penunjang atau faktor sosial ekonomi yang mempengaruhi efisiensi produksi. Regresi Tobit merupakan analisis regresi yang digunakan regresi dengan variabel bebas yang sebahagian datanya berskala pengukuran diskrit dan sebahagian lainnya berskala kontinu. Variabel terikat disebut data tersensor yaitu bahwa nilai dari variabel terikat terkonsentrasi atau

terkelompok pada satu nilai. Sebaran data tersensor adalah sebaran normal tersensor (Lin et.al., 2022).

Model analisis Regresi Tobit, sebagaimana menurut Amemiya, (1984) dapat dilihat pada persamaan berikut :

$$Y_i = \beta_0 + \beta_1 Z_{i1} + \beta_2 Z_{i2} + \dots + \beta_n Z_{im} + \varepsilon \dots \dots \dots (2.3)$$

Di mana :  $0 \leq Y_i \leq 1$

$i = 1, 2 \dots n$

$m = 1, 2, \dots n$

Keterangan :

$Y_i$  = variabel dependen

$\beta_n$  = koefisien regresi

$X_{im}$  = variabel independen

$\varepsilon$  = residu atau sisa

Selain itu, DEA tidak memperkirakan efektivitas sumber daya/input yang digunakan, DEA hanya mengukur efisiensi DMU saja dibandingkan dengan DMU yang paling efisien (Jalilov et al., 2019). Proses produksi pertanian termasuk budi daya kelapa sawit, merupakan sistem yang kompleks-dinamis yang terdiri dari kombinasi subsistem fisik dan sosial yang bekerja sama selama periode waktu tertentu. Petani sebagai manajer usahatani, harus selalu memutuskan produk apa yang akan mereka hasilkan dan cara menghasilkannya. Baik faktor internal yang dapat dikendalikan maupun eksternal yang tidak dapat dikendalikan membatasi peluang petani selama proses pengambilan keputusan. Seringkali, pengambilan keputusan adalah kumpulan tindakan dari berbagai pilihan untuk mencapai tujuan tertentu.

Kemampuan petani dalam mengidentifikasi, mengorganisasikan serta mengkoordinasikan berbagai faktor produksi dengan cara yang paling efisien sehingga proses produksi pertanian menghasilkan hasil yang optimal disebut pengelolaan usahatani. Faktor produksi utama perkebunan kelapa sawit adalah lahan, tenaga kerja, pupuk dan pestisida. Areal tempat tumbuh tanaman kelapa sawit disebut lahan, dan luasnya diukur dalam satuan luas lahan, yaitu hektar. Jumlah tenaga kerja yang terlibat dalam pengelolaan

perkebunan kelapa sawit rakyat disebut sebagai tenaga kerja yang terdiri dari tenaga kerja dalam keluarga petani dan tenaga kerja luar keluarga petani, yang dihitung berdasarkan satuan hari kerja pria (HKP). Pupuk adalah semua pupuk yang digunakan untuk mengelola perkebunan kelapa sawit, termasuk pupuk kimia dan organik, yang diukur dalam kilogram. Sementara pestisida dalam hal ini berupa herbisida, adalah semua herbisida yang dipergunakan oleh petani dalam pengelolaan perkebunan kelapa sawit rakyat, yang diukur dalam liter.

Keterlibatan faktor produksi dapat dinilai berdasarkan nilai dari masing-masing faktor produksi. Keterlibatan lahan dihitung berdasarkan perkiraan sewa lahan yang berlaku dalam satuan rupiah. Keterlibatan tenaga kerja dihitung berdasarkan besarnya nilai upah tenaga kerja keluarga dan perkiraan nilai pencurahan tenaga kerja dalam keluarga dalam satuan rupiah. Keterlibatan pupuk dihitung berdasarkan nilai pembelian pupuk dalam satuan rupiah. Keterlibatan pesetisida dihitung berdasarkan nilai pembelian pestisida dalam satuan rupiah. Proses produksi yang melibatkan faktor produksi menghasilkan produksi dalam bentuk tandan buah segar dalam satuan kilogram.

Uji Regresi Non Linier Berganda digunakan untuk menganalisis pengaruh faktor produksi utama terhadap produksi perkebunan kelapa sawit rakyat baik secara parsial (masing-masing faktor produksi) maupun secara simultan (faktor produksi secara bersama-sama).

Tingkat kemajuan dan keberhasilan pengelolaan perkebunan kelapa sawit rakyat diketahui dari nilai efisiensi produksi usahatani, yang meliputi efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif. Analisis efisiensi tersebut dilakukan dengan Data Envelopment Analysis sehingga dapat ditentukan kemampuan petani dalam mengelola input (faktor produksi utama) untuk mencapai pengelolaan usahatani yang efisien. Informasi lain yang diperoleh adalah besarnya pengurangan input yang harus dilakukan petani dalam upaya mencapai pengelolaan usahatani yang efisien.

Efisiensi produksi perkebunan kelapa sawit rakyat diduga dipengaruhi oleh faktor produksi penunjang. Faktor produksi penunjang tersebut adalah faktor di luar input yang digunakan petani dalam usahatani. Faktor penunjang tersebut berasal dari status dan keberadaan petani dalam berusaha meliputi jenis kelamin, umur, pendidikan,

pengalaman bertani, ukuran keluarga, kategori bibit, jumlah tanaman produktif, akses kredit, jarak ke pasar input, aplikasi pupuk organik, organisasi petani serta penggunaan sarana informasi dan teknologi. Uji Regresi Censored Tobit dilakukan untuk mengetahui pengaruh faktor penunjang terhadap efisiensi produksi perkebunan kelapa sawit rakyat. Hasil dari uji pengaruh faktor penunjang terhadap efisiensi produksi perkebunan kelapa sawit rakyat tersebut kemudian akan dijadikan menjadi dasar pertimbangan yang dapat dilakukan dalam upaya peningkatan efisiensi perkebunan kelapa sawit rakyat pada masa yang akan datang.

Berikut ini akan disajikan kerangka pemikiran penelitian dalam bentuk skema kerangka pemikiran seperti pada Gambar 3.

Gambar 3. Skema Kerangka Pemikiran

### 2.3 Hipotesis Penelitian

Rumusan hipotesis penelitian ini adalah sebagai berikut :

- a) Luas lahan, tenaga kerja, pupuk dan pestisida berpengaruh terhadap produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.
- b) Jenis kelamin, umur, pendidikan, pengalaman bertani, ukuran keluarga, kategori bibit, jumlah tanaman produktif, akses kredit, jarak ke pasar input, aplikasi pupuk organik, organisasi petani serta penggunaan sarana informasi dan teknologi berpengaruh terhadap efisiensi produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara.

### III. METODE PENELITIAN

#### 3.1 Lokasi dan Waktu Penelitian

##### 3.1.1 Lokasi Penelitian

Lokasi penelitian ini adalah daerah Provinsi Sumatera Utara yang ditentukan secara purposif (sengaja), dengan pertimbangan bahwa wilayah ini adalah merupakan wilayah yang tergolong penting dalam hal perkebunan kelapa sawit, yang menduduki urutan ketiga ditinjau dari luas areal perkebunan kelapa sawit dan urutan kelima luas areal perkebunan kelapa sawit rakyat di Indonesia (Direktorat Jenderal Perkebunan, 2024).

Perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara berada di 22 kabupaten/kota di mana wilayah Provinsi Sumatera Utara yang terbagi atas empat kawasan yaitu Pantai Timur, Dataran Tinggi, Pantai Barat dan Kepulauan Nias. Kawasan Pantai Timur meliputi Kabupaten Labuhanbatu, Kabupaten Labuhanbatu Utara, Kabupaten Labuhanbatu Selatan, Kabupaten Asahan, Kabupaten Batu Bara, Kabupaten Deli Serdang, Kabupaten Langkat, Kabupaten Serdang Bedagai, Kota Tanjungbalai, Kota Tebing Tinggi, Kota Medan, dan Kota Binjai. Kawasan Dataran Tinggi meliputi Kabupaten Simalungun, Kabupaten Dairi, Kabupaten Karo, Kabupaten Tapanuli Utara, Kabupaten Humbang Hasundutan, Kabupaten Pakpak Bharat, Kabupaten Samosir dan Kota Pematangsiantar. Kawasan Pantai Barat meliputi Kabupaten Mandailing Natal, Kabupaten Tapanuli Selatan, Kabupaten Padang Lawas, Kabupaten Padang Lawas Utara, Kabupaten Tapanuli Tengah, Kota Padang Sidempuan dan Kota Sibolga. Kawasan Kepulauan Nias meliputi Kabupaten Nias, Nias Utara, Nias Barat, Nias Selatan dan Kota Gunungsitoli (BPS Sumatera Utara, 2024).

##### 3.1.2 Waktu Penelitian

Penelitian dilakukan pada Bulan Agustus 2024 hingga Bulan Maret 2025, untuk pengelolaan (proses produksi) perkebunan kelapa sawit rakyat di daerah penelitian selama satu tahun yaitu Tahun 2023.

### 3.2. Populasi dan Sampel Penelitian

Populasi penelitian adalah seluruh rumah tangga perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara yang berjumlah berjumlah 236.619 kepala keluarga yang bekerja sebagai petani (Direktorat Jenderal Perkebunan, 2024). Penarikan sampel dilakukan secara bertingkat (*multistage sampling*) yaitu metode penarikan sampel yang dilakukan dalam beberapa tahap. Tahap pertama dilakukan secara purposif berdasarkan pertimbangan karena kabupaten tersebut merupakan wilayah yang memiliki luas lahan perkebunan kelapa sawit rakyat terbesar untuk masing-masing Kawasan di Provinsi Sumatera Utara, sehingga terpilih 3 kabupaten yang masing-masing mewakili Kawasan Pantai Timur, Dataran Tinggi dan Pantai Barat. Kabupaten yang terpilih adalah Kabupaten Asahan, Kabupaten Simalungun dan Kabupaten Padang Lawas. Tahap kedua dilakukan pemilihan wilayah kecamatan secara purposif berdasarkan keberadaan luas lahan perkebunan kelapa sawit rakyat yang dimiliki sehingga terpilih masing-masing 1 kecamatan untuk mewakili setiap kabupaten yang terpilih sebelumnya. Kecamatan yang terpilih adalah Kecamatan Bandar Pulau, Kecamatan Hatonduhan dan Kecamatan Lubuk Barumon yang merupakan wilayah kecamatan dengan keberadaan luas lahan perkebunan kelapa sawit terbesar untuk masing-masing kabupaten terpilih. Tahap ketiga dilakukan secara purposif dengan memilih masing-masing 2 desa pada setiap kecamatan terpilih yang merupakan desa dengan perkebunan kelapa sawit rakyat utama di setiap kecamatan. Desa yang terpilih adalah Desa Gonting Malaha dan Desa Padang Pulau untuk Kecamatan Bandar Pulau, Desa Buntu Turunan dan Desa Buntu Bayu untuk Kecamatan Hatonduhan serta Desa Aek Lancat dan Desa Pagaran Mompang untuk Kecamatan Lubuk Barumon. Tahap keempat adalah penarikan sampel ditentukan secara *simple random sampling* dengan jumlah sampel 75 petani untuk setiap desa, sehingga total sampel penelitian adalah 450 petani perkebunan kelapa sawit rakyat. Pada Tabel 4 akan diuraikan distribusi sampel penelitian.

Tabel 4. Distribusi Sampel Penelitian

| No. | Nama Kabupaten | Nama Kecamatan | Nama Desa       | Sampel (KK) |
|-----|----------------|----------------|-----------------|-------------|
| 1   | Asahan         | Bandar Pulau   | Gonting Malaha  | 75          |
|     |                |                | Padang Pulau    | 75          |
| 2   | Simalungun     | Hatonduhan     | Buntu Turunan   | 75          |
|     |                |                | Buntu Bayu      | 75          |
| 3   | Padang Lawas   | Lubuk Barumun  | Aek Lancat      | 75          |
|     |                |                | Pagaran Mompang | 75          |
|     |                |                | Jumlah          | 450         |

*Sumber : BPS Provinsi Sumatera Utara (2024), BPS Kabupaten Asahan (2024), BPS Kabupaten Simalungun (2024), BPS Kabupaten Padang Lawas (2024), Data Pra Survei (2024)*

### 3.3 Teknik Pengumpulan Data dan Analisis Data

#### 3.3.1 Teknik Pengumpulan Data

Data yang digunakan dalam penelitian ini terdiri dari data primer dan data sekunder yang diperoleh melalui upaya sebagai berikut:

- Data primer merupakan data yang secara langsung diperoleh dari petani di daerah penelitian melalui wawancara dengan menggunakan daftar pertanyaan (kuesioner) yang telah disusun sebelumnya.
- Daftar sekunder adalah yang diperoleh melalui pengumpulan data dari instansi terkait yang relevan misalnya Badan Pusat Statistika (BPS), Direktorat Jendral Perkebunan, jurnal dan text book sesuai kebutuhan penelitian.

#### 3.3.2 Analisis Data

Langkah pertama yang dilakukan adalah mengadakan tabulasi dari data primer yang diperoleh dari sampel penelitian, kemudian dilakukan analisis data sesuai dengan masalah penelitian.

#### a. Pengaruh Faktor Produksi Utama Terhadap Produksi Perkebunan Kelapa Sawit Rakyat

Pengaruh faktor produksi utama (luas lahan, tenaga kerja, pupuk dan pestisida) terhadap produksi dianalisis dengan penggunaan Fungsi Produksi Cobb-Douglas melalui Uji Regresi Non Linier Berganda yang sangat luas pemakaiannya sebagai fungsi produksi usahatani (pertanian) sebagaimana menurut Archontoulis and Miguez (2015), Gujarati

and Porter (2013) dan Debertin (2012) yang dapat dituliskan dalam persamaan regresi:

$$Y = b_0 X_1^{b_1} X_2^{b_2} X_3^{b_3} X_4^{b_4} e^u \dots\dots\dots(3,1)$$

yang dilinierkan menjadi  $\ln Y = \ln b_0 + b_1 \ln X_1 + b_2 \ln X_2 + b_3 \ln X_3 + b_4 \ln X_4 + u \dots\dots\dots(3,2)$

Keterangan : Y = outout (produksi) perkebunan kelapa sawit rakyat (kg)

$X_1$  = luas lahan (ha)

$X_2$  = pencurahan tenaga kerja (HKP)

$X_3$  = jumlah pupuk (kg)

$X_4$  = jumlah pestisida (liter)

$b_0$  = intercept

$b_i$  = koefisien regresi

u = error term

Uji signifikansi pengaruh secara parsial variabel bebas ( $X_i$ ) terhadap variabel terikat (Y) dilakukan dengan Uji t dengan kriteria pengujian sebagai berikut:

- 1) Apabila nilai probability  $t \geq 0,05$  maka  $H_0$  diterima,  $H_1$  ditolak.
- 2) Apabila nilai probability  $t < 0,05$  maka  $H_0$  ditolak,  $H_1$  diterima.

Uji signifikansi pengaruh secara simultan variabel bebas ( $X_i$ ) terhadap variabel terikat (Y) dilakukan dengan Uji t dengan kriteria pengujian sebagai berikut:

- 1) Apabila nilai probability  $F \geq 0,05$  maka  $H_0$  diterima,  $H_1$  ditolak.
- 2) Apabila nilai probability  $F < 0,05$  maka  $H_0$  ditolak,  $H_1$  diterima.

Besar pengaruh  $X_1$ ,  $X_2$ ,  $X_3$  dan  $X_4$  terhadap Y dapat dijelaskan dari besaran nilai koefisien determinasi ( $R^2$ ).

#### **b. Perhitungan Efisiensi Produksi Perkebunan Kelapa Sawit Rakyat**

Perhitungan efisiensi yang dilakukan meliputi perhitungan efisiensi teknis, efisiensi ekonomi dan efisiensi ekonomi. Penggunaan input produksi dalam suatu proses produksi dikatakan efisien apabila efisiensi penggunaannya = 1. Perhitungan efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif) adalah dengan penggunaan Data Envelopment Analysis (DEA). DEA yang digunakan adalah model DEA VRS (*variabel return to scale*) yang juga dikenal dengan efisiensi murni, untuk menghitung efisiensi ketika peningkatan atau penurunan input tidak menghasilkan perubahan yang proporsional pada output. Rusydiana (2013) dalam Sulistyaningsih

et.al., (2019) menjelaskan bahwa model DEA VRS memiliki asumsi bahwa sebuah perusahaan tidak atau belum berlangsung pada pada skala yang optimal. Model DEA VRS dapat menunjukkan skala hasil yang meningkat (*increasing return*), konstan (*constant return*) dan menurun (*decreasing return*).

Efisiensi teknis menunjukkan kemampuan perusahaan dalam mencapai output yang maksimal dengan meminimalkan penggunaan input dalam suatu proses produksi seperti yang diuarikan oleh Adzawla and Alhassan (2021) dan Saeri et.al., (2021) dengan rumus sebagai berikut:

$$TE_i = \frac{Y_i}{Y_{i*}} \dots\dots\dots(3.3)$$

Di mana  $0 \leq TE_i \leq 1$ .

Keterangan : TE = efisiensi teknis

$Y_i$  = produksi aktual

$Y_{i*}$  = produksi frontier

Metode *Data Envelopment Analysis* yang digunakan untuk menganalisis efisiensi teknis terdiri atas dua orientasi yaitu orientasi input dan orientasi output. Dalam penelitian ini digunakan DEA berorientasi input yang berfokus pada pengurangan input pada tingkat output tertentu. Dalam konteks ini,  $\lambda$  merupakan nilai efisiensi teknis (TE) untuk perkebunan rakyat ke-k, yang bervariasi antara 0 dan 1. Variabel tersebut menunjukkan vektor keluaran tandan buah segar dari kelapa sawit, sementara  $\lambda$  menunjukkan vektor jumlah input meliputi lahan, tenaga kerja, pupuk dan pestisida. Selain itu,  $\lambda$  mengacu pada vektor pembobotan di mana kendala VRS dinyatakan sebagai  $\sum_{k=1}^m \lambda_k = 1$ . Dengan demikian, formulasi untuk orientasi input DEA, beserta asumsi VRS untuk mengevaluasi efisiensi teknis menurut Piran et.al., (2020) dapat diartikulasikan sebagai berikut:

$$\min \theta_k \dots\dots\dots(3.4)$$

Dengan kendala

$$\begin{aligned} -y_j + y_{jk}\lambda_{jk} &\geq 0; \forall j = 1 \\ \theta_k x_i - x_{ik}\lambda_k &\geq 0; \forall i = 1, \dots, 4 \\ \sum_{k=1}^m \lambda_k &= 1; \forall k = 1, \dots, m \\ \lambda &\geq 0 \end{aligned}$$

Keterangan:  $\theta$  = nilai efisiensi teknis

$Y_i$  = jumlah output kelapa sawit (kg tandan buah segar)

$X_i$  = jumlah input (lahan, tenaga kerja, pupuk dan pestisida)

$\forall_k$  = jumlah sampel.

Efisiensi ekonomi dihitung dengan model efisiensi biaya di mana minimalisasi biaya atau efisiensi ekonomi (EE) dari vektor input ke-i untuk DMU adalah,  $X_i$  vektor harga masukan adalah  $W'_i$ , dan tingkat keluarannya adalah  $Y_i$ . Secara keseluruhan, skor EE dari DMU ke-i dihitung sebagai rasio biaya minimum, di mana biaya tersebut diamati dan sebanding dengan skor EE. Jika  $EE = 1$  dianggap efisien secara ekonomi,  $EE < 1$  menunjukkan EE tidak tercapai (Jahanshahloo et.al., 2008).

Dengan demikian Efisiensi Ekonomi (EE) dapat dihitung berdasarkan persamaan:

$$EE = \frac{W'_i X'_i}{W'_i X_i} \dots \dots \dots (3,5)$$

Keterangan: EE = efisiensi ekonomi ( $0 \leq EE \leq 1$ )

$X_i$  = jumlah input aktual (lahan, tenaga kerja, pupuk dan pestisida)

$W'_i$  = harga input

$X_i^*$  = jumlah target input

Efisiensi alokatif (efisiensi harga) adalah perbandingan antara efisiensi ekonomi dan efisiensi teknis atau dapat dihitung berdasarkan persamaan :

$$AE = \frac{EE}{TE} \dots \dots \dots (3,6)$$

Efisiensi alokatif (AE) menandakan kemampuan pertanian untuk menyamakan nilai produk marjinal dengan biaya marjinal. Jika  $AE = 1$ , berarti usahatani tersebut telah mencapai harga yang efisien. Nilai AE yang lebih kecil dari satu berarti usahatani berada dalam kondisi tidak efisien dari segi harga, sehingga biaya harus diminimalkan, sedangkan nilai  $AE > 1$  berarti usahatani belum mencapai efisiensi harga.

Pengurangan input merupakan hasil pengurangan input aktual dengan target input yang didapatkan dari model DEA. Besarnya persentase pengurangan input tersebut dapat dihitung berdasarkan rumus:

$$\text{Presentase pengurangan input (\%)} = \frac{\text{Input aktual} - \text{target input}}{\text{input aktual}} \times 100 \% \dots \dots \dots (3,7)$$

Di mana :

- Input aktual adalah nilai penggunaan input yang jumlahnya yang diperoleh dari hasil wawancara dengan petani.
- Target input adalah nilai penggunaan input yang dianjurkan yang diperoleh setelah melakukan analisis DEA.

### c. Faktor Produksi Penunjang Yang Mempengaruhi Efisiensi Produksi

Pengaruh faktor produksi penunjang terhadap efisiensi produksi perkebunan kelapa sawit rakyat dapat dianalisis dengan penggunaan Uji Regresi *Censored Tobit* (*Censored Tobit Regression*). Menurut Lin et.al., (2022) metode tersebut menggunakan asumsi bahwa variabel bebas yang digunakan mempunyai nilai yang tidak terbatas (*non-censored*) dan hanya variabel tidak bebas yang mempunyai nilai yang terbatas (*censored*). Semua variabel bebas maupun tidak bebas yang digunakan dapat diukur dengan benar, tidak ada autokorelasi, tidak ada heteroskedastisitas, tidak ada multikolinearitas yang sempurna dan model matematis yang digunakan menjadi tepat.

Fungsi Regresi Tobit dalam penelitian ini dituliskan sebagaimana yang diuraikan Amemiya, (1984) sebagai berikut :

$$Y = b_0 + b_1Z_1 + b_2Z_2 + \dots + \dots + b_{12}Z_{12} + e \dots \dots (3,8)$$

Keterangan : Y = nilai efisiensi produksi (efisiensi teknis, efisiensi ekonomi dan efisiensi alokatif)

$b_0$  = titik potong (intercept)

$b_1$ - $b_{12}$  = koefisien regresi

$Z_1$  = jenis kelamin (0 = wanita ; 1 = pria)

$Z_2$  = umur (tahun)

$Z_3$  = pendidikan (tahun)

$Z_4$  = pengalaman bertani (tahun)

$Z_5$  = ukuran keluarga (jiwa)

$Z_6$  = kategori bibit (0 = tidak bersertifikat ; 1 = bersertifikat)

$Z_7$  = Jumlah tanaman (pokok)

$Z_8$  = akses kredit (0 = tidak ada ; 1 = ada)

$Z_9$  = jarak ke pasar input (km)

$Z_{10}$  = aplikasi pupuk organik (tahun)

$Z_{11}$  = organisasi petani (tahun)

$Z_{12}$  = penggunaan sarana informasi dan teknologi (tahun)

Sebelum melakukan analisis data penelitian dan pengujian hipotesis, maka terlebih dahulu dilakukan uji persyaratan analisis yaitu Uji Heteroskedastisitas dan Uji

Multikolinearitas.

Uji heteroskedastisitas yang digunakan untuk menilai ada tidaknya heteroskedastisitas dalam model adalah Uji Breusch Pagan/Cook yaitu dengan kriteria pengujian apabila nilai signifikansi  $> \alpha$  menunjukkan tidak adanya heteroskedastisitas dan nilai signifikansi  $\leq \alpha$  menunjukkan adanya heteroskedastisitas (Aguade et al. 2022).

Uji multikolinearitas yang digunakan untuk menilai ada tidaknya korelasi antara variabel bebas dalam model adalah dengan penggunaan VIF (*Variance Inflation Factors*). Apabila nilai VIF  $< 5$  maka tidak terjadi multikolinearitas dan apabila nilai VIF  $> 5$  menunjukkan terjadinya multikolinearitas dalam model (Marcoulides and Raykov, 2019).

Untuk mengetahui pengaruh secara parsial variabel bebas ( $Z_i$ ) terhadap variabel terikat ( $Y$ ) dilakukan Uji Z, dengan menggunakan kriteria sebagai berikut:

- 1) Apabila nilai probability  $Z \geq 0,05$  maka  $H_0$  diterima,  $H_1$  ditolak.
- 2) Apabila nilai probability  $Z < 0,05$  maka  $H_0$  ditolak,  $H_1$  diterima.

Untuk mengetahui pengaruh secara simultan variabel bebas ( $X_i$ ) terhadap variabel terikat ( $Y$ ) dilakukan Uji Rasio Likelihood atau Uji G dengan menggunakan kriteria pengujian sebagaimana menurut Upaya (2021) sebagai berikut:

- 1) Apabila nilai probability rasio likelihood  $\geq 0,05$  maka  $H_0$  diterima,  $H_1$  ditolak.
- 2) Apabila nilai probability rasio likelihood  $< 0,05$  maka  $H_0$  ditolak,  $H_1$  diterima.

Besarnya pengaruh  $X_1, X_2, \dots, X_{12}$  terhadap  $Y$  dapat ditentukan berdasarkan nilai koefisien determinasi ( $R^2$ ).

### 3.4 Batasan Operasional Penelitian

Batasan operasional penelitian ini adalah sebagai berikut :

- a. Perkebunan kelapa sawit rakyat adalah usahatani yang mengusahakan tanaman kelapa sawit yang diusahakan (dikelola) oleh petani dan keluarganya dengan status tidak memiliki badan hukum.
- b. Petani sampel adalah petani yang mengusahakan perkebunan kelapa sawit rakyat dengan tanaman kelapa sawit berumur 3 – 25 tahun (umur produktif).

- c. Lahan adalah ukuran luas lahan yang digunakan petani untuk pengelolaan perkebunan kelapa sawit rakyat dalam satuan hektar.
- d. Tenaga kerja adalah pencurahan tenaga kerja yang dilibatkan oleh petani dalam pengelolaan perkebunan kelapa sawit rakyat yang jumlahnya diukur dalam satuan Hari Kerja Pria (HKP).
- e. Pupuk adalah pupuk yang digunakan oleh petani dalam pengelolaan perkebunan kelapa sawit rakyat yang diukur dalam satuan kg.
- f. Pestisida adalah pestisida yang digunakan oleh petani dalam pengelolaan perkebunan kelapa sawit rakyat yang diukur dalam satuan liter.
- g. Produksi adalah total hasil (output) perkebunan kelapa sawit rakyat yang diperoleh petani selama satu tahun dalam bentuk tandan buah segar (TBS) dalam satuan kg.
- h. Efisiensi teknis adalah ukuran kemampuan penggunaan input minimal untuk memperoleh produksi maksimal yang dipersyaratkan.
- i. Efisiensi ekonomi adalah kemampuan penggunaan input dengan biaya input yang minimal untuk memperoleh produksi maksimal yang dipersyaratkan.
- j. Efisiensi alokatif adalah kemampuan penggunaan input secara optimal pada harga dan teknologi produksi tertentu untuk memperoleh produksi maksimal yang dipersyaratkan.
- k. Jenis kelamin adalah jenis kelamin petani sebagai pengelola usahatani perkebunan rakyat (0 = Wanita, 1 = Pria).
- l. Umur adalah umur petani hingga saat penelitian dilakukan (tahun).
- m. Pendidikan adalah ukuran lamanya petani mengikuti pendidikan formal di bangku sekolah (tahun).
- n. Ukuran keluarga adalah jumlah anggota keluarga petani pengelola usahatani perkebunan rakyat yang hidup dari satu sumber pendapatan yang sama (jiwa).
- o. Kategori bibit adalah adalah klassifikasi jenis bahan tanaman kelapa sawit yang diusahakan petani perkebunan kelapa sawit rakyat pada usahatani yang diteliti ( 0 = tidak bersertifikat, 1 = bersertifikat).
- p. Jumlah tanaman adalah jumlah pohon kelapa sawit produktif yang dikelola petani pada lahan usahatannya (pokok).

- q. Akses kredit adalah upaya yang dilakukan petani dalam memperoleh kredit untuk pembiayaan usahatani perkebunan kelapa sawit rakyat (0 = tidak ada, 1 = ada).
- r. Jarak ke pasar input adalah jarak tempat tinggal petani perkebunan kelapa sawit rakyat dengan pasar input yang digunakan dalam pengelolaan usahatani (km).
- s. Aplikasi pupuk organik adalah lamanya pengalaman petani telah mengaplikasikan pupuk organik dalam pengelolaan usahatani perkebunan kelapa sawit rakyat (tahun).
- t. Organisasi petani adalah pengalaman keikutsertaan petani dalam organisasi petani kelapa sawit rakyat di daerah tempat tinggalnya (tahun).
- u. Penggunaan sarana informasi dan teknologi adalah lamanya pengalaman petani telah menggunakan sarana informasi dan teknologi yang berhubungan dengan pengelolaan perkebunan kelapa sawit rakyat (tahun).
- v. Penelitian dilakukan selama satu tahun yaitu Tahun 2024, dengan menggunakan data pengelolaan perkebunan kelapa sawit adalah untuk masa produksi satu tahun yaitu Tahun 2023.
- w. Pengolahan data penelitian menggunakan aplikasi Microsoft Excell 2021, DEA Max 12 dan Stata 17.

## VI. SIMPULAN DAN REKOMENDASI

### 6.1 Simpulan

Berdasarkan analisis data penelitian dan pembahasan yang telah dilakukan, maka dapat diuraikan beberapa simpulan sebagai berikut:

- a. Produksi perkebunan kelapa sawit rakyat dipengaruhi secara simultan oleh faktor produksi utama yang terdiri dari lahan, tenaga kerja pupuk dan pestisida. Pengaruh faktor produksi utama secara parsial terhadap produksi perkebunan kelapa sawit rakyat menunjukkan bahwa lahan berpengaruh positif, tenaga kerja dan pupuk tidak berpengaruh sementara pestisida berpengaruh negatif.
- b. Proses produksi perkebunan kelapa sawit rakyat di Provinsi Sumatera Utara belum efisien secara teknis, ekonomi dan alokatif.
- c. Efisiensi teknis perkebunan kelapa sawit rakyat dipengaruhi secara simultan oleh faktor produksi penunjang. Faktor produksi penunjang yang secara parsial berpengaruh terhadap efisiensi teknis perkebunan kelapa sawit rakyat adalah jenis kelamin, umur, pengalaman bertani, ukuran keluarga, kategori bibit, jarak ke pasar input, organisasi petani dan penggunaan sarana informasi dan teknologi.

- d. Efisiensi ekonomi perkebunan kelapa sawit rakyat dipengaruhi secara simultan oleh faktor produksi penunjang. Faktor produksi penunjang secara simultan berpengaruh terhadap efisiensi alokatif perkebunan kelapa sawit rakyat. Faktor produksi penunjang yang secara parsial berpengaruh terhadap efisiensi alokatif perkebunan kelapa sawit rakyat adalah jenis kelamin, umur, pendidikan, pengalaman bertani, ukuran keluarga, kategori bibit, jumlah tanaman produktif, jarak ke pasar input, organisasi petani dan penggunaan sarana informasi dan teknologi.
- e. Efisiensi alokatif perkebunan kelapa sawit rakyat dipengaruhi secara simultan oleh faktor produksi penunjang. Faktor produksi penunjang yang secara parsial berpengaruh terhadap efisiensi alokatif perkebunan kelapa sawit rakyat adalah jenis kelamin, umur, pendidikan, pengalaman bertani, ukuran keluarga, kategori bibit, jumlah tanaman produktif, jarak ke pasar input, organisasi petani dan penggunaan sarana informasi dan teknologi.

## **6.2 Rekomendasi**

### **6.2.1 Kepada Petani**

Demi peningkatan kinerja perkebunan rakyat di Provinsi Sumatera Utara, maka kepada petani perkebunan kelapa sawit rakyat diberikan rekomendasi sebagai berikut:

- a. Agar melakukan perencanaan penggunaan faktor produksi utama (input) yang lebih rasional pada masa yang akan datang. Apabila petani tidak dapat menerapkan teknologi baru dalam pengelolaan perkebunan rakyat, maka sebaiknya mempertimbangkan pengurangan penggunaan input lahan, tenaga kerja, pupuk dan pestisida.
- b. Agar petani selalu aktif dalam organisasi petani sebagai wahana belajar dan tukar menukar informasi antar petani.
- c. Agar petani lebih aktif dalam penggunaan sarana informasi dan teknologi yang berhubungan langsung dengan pengelolaan usahatani yaitu sebagai sumber informasi dan pengetahuan kultur teknis pengelolaan perkebunan kelapa sawit rakyat.

### **6.2.1 Kepada Pemerintah**

Agar pemerintah dapat lebih membantu petani perkebunan kelapa sawit rakyat melalui upaya-upaya sebagai berikut :

- a. Pembinaan organisasi petani yang berfungsi sebagai sarana belajar, tukar menukar informasi, penyediaan input dan pemasaran produksi perkebunan kelapa sawit rakyat.
- b. Penyediaan informasi yang terkait dengan pengelolaan perkebunan kelapa sawit dalam bentuk aplikasi yang dengan mudah dapat diakses oleh petani.
- c. Membantu permodalan petani perkebunan kelapa sawit rakyat terutama ketika akan melakukan penanaman kembali maupun ketika membuka usaha perkebunan kelapa sawit rakyat.

#### Keterangan :

X1 = Jenis Kelamin (0 = Wanita ; 1 = Pria)

X2 = Umur Petani (Tahun)

X3 = Pendisikan (Tahun)

X4 = Pengalaman Bertani (Tahun)

X5 = Ukuran Keluarga (Jiwa)

X6 = Jenis Bibit (0 = Tidak Bersertifikat ; 1 = Bersertifikat)

X7 = Jumlah Tanaman (Pokok)

X8 = Akses Kredit (0 = Tidak Melaksanakan ; 1 = Melaksanakan)

X9 = Jarak ke Pasar Input (Km)

X10 = Pengalaman Aplikasi Pupuk Organik (Tahun)

X11 = Pengalaman Keikutsertaan Organisasi (Tahun)

X12 = Pengalaman Menggunakan Sarana IT (Tahun)

### Lampiran 5. Uji Pengaruh Lahan, Tenaga Kerja, Pupuk dan Pestisida Terhadap Produksi Kelapa Sawit

## KUESIONER PENELITIAN

### I. IDENTITAS PETANI

1. Nama Petani (Kepala Keluarga) : .....
2. Alamat
  - a. Dusun : .....
  - b. Desa : .....
  - c. Kecamatan : .....
  - d. Kabupaten : .....

### II. IDENTITAS USAHATANI

1. Luas Lahan Tanaman Menghasilkan (ha) : .....
2. Status Lahan (milik/sewa/sakap) : .....
3. Umur Tanaman (tahun) : .....

### III. FAKTOR SOSIAL EKONOMI PETANI

1. Jenis Kelamin : .....
2. Umur : ..... Tahun
3. Pendidikan : .....Tahun
4. Pengalaman berusahatani kelapa sawit : ..... Tahun
5. Jumlah anggota keluarga : ..... Jiwa
6. Asal Bibit (Jenis Bibit Kelapa Sawit Yang Digunakan : Ya/Tidak Bersertifikat
7. Jumlah Tanaman Produktif Yang Diusahakan Saat ini : ..... Pokok
8. Melakukan peminjaman kredit : .... Ya, ..... Tidak
9. Jarak tempat tinggal ke tempat pembelian input pertanian : ..... Km
10. Pengalaman menggunakan pupuk organik dalam usahatani : ..... Tahun
11. Pengalaman menjdsi anggota organisasi petani: Ya =..... Tahun, Tidak = 0 Tahun
12. Pengalaman menggunakan sarana informasi dan teknologi (misalnya handphone, laptop) untuk mengakses informasi atau teknologi yang berkaitan dengan pengelolaan usahatani: Ya = ..... Tahun, Tidak = 0 Tahun.

#### IV. PENGGUNAAN FAKTOR PRODUKSI (INPUT) DALAM SATU TAHUN

##### A. LAHAN

Besar biaya sewa lahan di lokasi usahatani = Rp...../tahun. Dengan demikian besarnya nilai penggunaan lahan dalam setahun = .....

##### B. TENAGA KERJA

Catatan : Nilai 1 HKP di Lokasi usahatani = Rp. ....../HKP

##### 1. PEMUPUKAN

- a. Berapa kali dilakukan pemupukan dalam satu tahun = ..... kali.
- b. Berapa TK yang terlibat :
  - 1) Dalam Keluarga >> Laki-Laki =..... orang ; Perempuan = ..... orang
  - 2) Luar Keluarga>> Laki-Laki =..... orang ; Perempuan = ..... orang
- c. Jumlah waktu yang digunakan setiap kali pemupukan = ..... Jam.
- d. Jumlah HKP yang digunakan dalam pemupukan/tahun =..... HKP
- e. Nilai penggunaan tenaga kerja untuk pemupukan = Rp...../tahun.

##### 2. PENYEMPROTAN

- a. Tujuan penyemprotan yang dilakukan adalah pengendalian Pengendalian 1) Gulma ; 2) Pengendalian Hama dan Penyakit
- b. Berapa kali dilakukan penyemprotan dalam satu tahun = ..... Kali.
- c. Berapa TK yang terlibat :
  - 1) Dalam Keluarga >> Laki-Laki =..... orang ; Perempuan = ..... orang
  - 2) Luar Keluarga>> Laki-Laki =..... orang ; Perempuan = ..... orang
- d. Jumlah waktu yang digunakan dalam setiap kali penyemprotan = .....Jam.
- e. Jumlah HKP yang digunakan dalam penyemprotan/tahun = .....HKP
- f. Nilai penggunaan tenaga kerja untuk penyemprotan = Rp...../tahun

##### 3. PEMBERSIHAN LAHAN/PIRINGAN

- a. Berapa kali dilakukan pembersihan lahan dalam satu tahun = ..... kali.
- b. Berapa TK yang terlibat :
  - 1) Dalam Keluarga >> Laki-Laki =..... orang ; Perempuan = .....orang
  - 2) Luar Keluarga>> Laki-Laki =..... orang ; Perempuan = ..... orang
- c. Jumlah waktu yang digunakan dalam setiap kali pembersihan lahan/piringan =..... Jam.

d. Jumlah HKP yang digunakan dalam pembersihan lahan/piringan/tahun = ..... HKP

e. Nilai penggunaan tenaga kerja untuk pembersihan lahan/piringan = Rp...../tahun.

#### 4. PEMANENAN

a. Frekuensi dilakukannya pemanenan dalam satu tahun = ..... kali.

b. Tenaga Kerja yang terlibat :

1) Dalam Keluarga >> Laki-Laki = ..... orang ; Perempuan = ..... orang

2) Luar Keluarga >> Laki-Laki = ..... orang ; Perempuan = ..... orang

c. Jumlah waktu yang digunakan dalam setiap kali pemanenan = .....Jam.

d. Jumlah HKP yang digunakan dalam pemanenan/tahun = .....HKP

e. Nilai penggunaan tenaga kerja untuk pemanenan = Rp...../tahun

### C. PUPUK

#### 1. PUPUK KIMIA

Jenis dan Jumlah Pupuk yang digunakan dalam satu tahun :

| No. | Nama Pupuk | Jumlah (kg) | Harga/kg (Rp) | Jumlah (Rp) |
|-----|------------|-------------|---------------|-------------|
| 1   |            |             |               |             |
| 2   |            |             |               |             |
| 3   |            |             |               |             |
| 4   |            |             |               |             |
| 5   |            |             |               |             |
|     |            |             | TOTAL         |             |

#### 2. PUPUK ORGANIK (JIKA DIGUNAKAN)

Jenis dan Jumlah Pupuk yang digunakan dalam satu tahun :

| No. | Nama Pupuk | Jumlah (kg) | Harga/kg (Rp) | Jumlah (Rp) |
|-----|------------|-------------|---------------|-------------|
| 1   |            |             |               |             |
| 2   |            |             |               |             |
| 3   |            |             |               |             |
|     |            |             | TOTAL         |             |

**D. PESTISIDA**

Jenis dan Jumlah Pestisida yang digunakan dalam satu tahun :

| No. | Nama Pestisida | Jumlah (kg) | Harga/kg (Rp) | Jumlah (Rp) |
|-----|----------------|-------------|---------------|-------------|
| 1   |                |             |               |             |
| 2   |                |             |               |             |
| 3   |                |             |               |             |
| 4   |                |             |               |             |
| 5   |                |             |               |             |
|     |                |             | TOTAL         |             |

**E. PENYUSUTAN ALAT**

Penyusutan alat dalam satu tahun

| No. | Nama Alat | Jumlah | Nilai Baru (Rp) | Umur Ekonomis | Penyusutan/ Tahun (Rp) |
|-----|-----------|--------|-----------------|---------------|------------------------|
| 1   |           |        |                 |               |                        |
| 2   |           |        |                 |               |                        |
| 3   |           |        |                 |               |                        |
| 4   |           |        |                 |               |                        |
| 5   |           |        |                 |               |                        |
| 6   |           |        |                 |               |                        |
| 7   |           |        |                 |               |                        |
|     |           |        |                 | TOTAL         |                        |

**V. PRODUKSI DAN NILAI PRODUKSI**

- Frekuensi panen (putaran panen) = .....kali/bulan = ..... kali/tahun.
- Sistem penjualan :
  - Pedagang menjemput hasil panen ke lokasi usahatani.
  - Petani menjual hasil panen ke tempat pedagang.
  - Petani menjual hasil panen ke PKS terdekat (langganan).

Produksi dan nilai produksi dalam satu tahun

| No. | Bulan    | Produksi TBS (Kg) | Harga Rata-Rata (Rp/kg) | Nilai Produksi (Rp) |

### Abstract

Modern management of smallholder oil palm plantations is very much needed to enable smallholder oil palm plantations to follow the progress of management of large oil palm plantations, both state-owned and privately owned. This study aims to determine how production factors influence production and to determine the technical efficiency of smallholder oil palm plantations. The location of the study was determined purposively based on the consideration of the existence of smallholder oil palm plantations in the area. The sample was determined by quota sampling of 150 samples from two villages, namely Buntu Bayu Village and Buntu Turunan Village, each with 75 samples. The analysis involves applying the Multiple Non-Linear Regression Test (Rank Test) alongside Data Envelopment Analysis, focusing on managing smallholder oil palm plantations throughout 2023. The study results show that, partially, the production of smallholder oil palm plantations is significantly positively influenced by each production factor. Conversely, the output of smallholder oil palm plantations is notably affected by various production factors, including land, labor, fertilizer, and pesticides. Most (78.00%) smallholder oil palm plantations are technically inefficient, with an average technical efficiency value of 0.9755. To achieve a technically efficient production process, smallholder plantation farmers must reduce inputs, namely 2.5416% of the land, 4.0501% of labor, 5.5449% of fertilizer, and 3.1165% of pesticides.

**Keywords:** Production; Smallholder Oil Palm Plantations; Technical Efficiency

### Introduction

Smallholder oil palm plantations represent a specific category of oil palm plantation management in Indonesia. Other forms of management statuses are large state plantations and large private plantations. Data from the Direktorat Jenderal Perkebunan (2024) shows that in 2023, the area of oil palm plantations in Indonesia was 15,435,656 hectares, consisting of 40.76% smallholder plantations, 3.53% large state plantations, and 55.71% large private plantations. It is projected that, in the future, smallholder oil palm plantations will prevail in terms of land area within Indonesia's oil palm sector. Therefore, its existence is also expected to continue to increase its contribution to Indonesia's economic development.

Based on land area, in 2023, North Sumatra Province will be the third-largest region with oil palm plantations and the fifth-largest region with smallholder oil palm plantations in Indonesia. In North Sumatra Province, smallholder oil palm plantations are distributed throughout 22 districts

and cities. Rapid development can be seen in the highland areas previously dominated by the East and West coasts, including Simalungun Regency. 2023 North Sumatra Province will have 488,414 hectares of smallholder oil palm plantations (Direktorat Jenderal Perkebunan, 2024).

Until now, the performance of smallholder plantations measured by productivity is still below that of large plantations. An analysis of the 2.2 million farmers managing smallholder plantations indicates that these plantations will play a crucial role in shaping the future of the palm oil industry in Indonesia. The primary challenge faced by smallholder oil palm plantations is their low productivity. This situation stems from inadequate management practices employed by farmers. Factors such as insufficient knowledge, limited technical skills in cultivation, and constrained capital resources contribute to subpar management practices. Until now, between smallholder oil palm plantations and large plantations, there is still a relatively high productivity gap, namely between 41 - 64% of the national oil palm plantation productivity of around 7 - 20 tons of FFB / ha/year (Suharno et.al., 2015).

Increasing the productivity and efficiency of smallholder plantations is very important in improving the performance of the plantation sector. The significant contribution of smallholder plantation production to national plantation production means that efforts to increase the efficiency of smallholder plantation production will significantly improve the efficiency of national plantation production (Setiyanto, 2015).

Efforts to increase agricultural production require good and proper management. The management in question is the ability of farmers to coordinate the use of production factors that they control as well as possible so that they can produce as expected. The limited productivity observed in smallholder oil palm plantations across Indonesia, particularly in North Sumatra Province, suggests that the efficiency of oil palm production remains suboptimal. Thus, this study aims to determine the influence of production factors on production and the value of technical efficiency of smallholder oil palm plantations, especially in Hatonduhan District, Simalungun Regency, North Sumatra Province.

## Literature Review

According to Debertin (2012), production theory consists of two theories: production theory with one variable input and production theory with two or more variable inputs. The production function is typically expressed as follows:

$$Y = f(x)$$

Where:

Y = Production results (output)

X = Number of the production factors (input) utilized

Numerous production processes necessitate various production factors, leading to the formulation of the production function as follows:

$$Y = f(x_1, x_2, x_3, x_4, \dots, \dots, x_n)$$

Explanation:

Y = Production results/number of products produced (output), is a variable influenced by production factors

X = Number of main production factors used (input), is a variable that influences Y.

The success of cultivating a type of plant is determined by the cultivated plant cultivar, the environmental/agroecological conditions of the place where the plant is cultivated, and the implementation of management by the farmer entrepreneur (Sasongko 2010). Farming production factors are the main factors needed in farming and, at the same time, become farming inputs. These farming production factors are combined to produce farming production or output through a production process (Arifin, 2015). The new farming production process can run well if the production factors and requirements are met. The farming production factors are classified into four elements, namely land, labor, capital, and skills or management (Daniel, 2002).

According to Nguyen et.al. (2018), measuring and studying production efficiency (including technical efficiency) in farming is a method used to determine the level of input use (input combination) by farmers in producing output as well as to determine the methods that can be used to increase efficiency.

Farrel (1957) proposed that efficiency consists of technical and allocative efficiency. Technical efficiency reflects farmers' ability to obtain maximum output from the amount of input given. There are two approaches to calculating efficiency: the input approach and the output approach. Efficiency measurement focuses on input use (Coelli et.al., 2005). According to (Chotimah, 2019), technical efficiency is a quantity that compares actual and maximum production. Technical efficiency will be achieved if farmers can allocate production factors to achieve high results.

Several studies have been conducted to analyze the technical efficiency of smallholder oil palm plantations in Indonesia. Yahyawileonides' (2022) research used Frontier Function analysis to analyze the technical efficiency of oil palm farming in Sanggau Regency, West Kalimantan. Varina et.al.'s (2020) research analyzed technical efficiency in Indonesia using empirical analysis techniques using the Meta-Frontier approach. Likewise, research Alwarritzi et.al. (2015). Ismiasih (2017) and Fariani et.al. (2019) used Stochastic Frontier analysis to analyze the technical efficiency of smallholder oil palm plantations.

From the description of the study of the technical efficiency of smallholder oil palm plantations above, research on the technical efficiency of oil palm plantations all use Stochastic Frontier analysis with the Cobb-Douglas Production Function. This study used Data Envelopment Analysis (DEA), which is relatively new in similar research.

## Research Method

The study area was selected intentionally, taking into account data from the North Sumatra Province BPS (2024) and the Simalungun Regency BPS (2024). This data indicates that Hatonduhan District has the largest smallholder oil palm plantation area within Simalungun Regency, which itself is the regency with the most extensive smallholder oil palm plantation area in the highlands of North Sumatra Province. The sample for this study was determined by Quota Sampling of 150 oil palm plantation farmers. The samples came from 2 villages in Hatonduhan District, namely Buntu Bayu Village and Buntu Turunan Village, each with 75 samples. The study material data was obtained directly from farmers through interviews using a prepared questionnaire, namely data on the management of smallholder oil palm plantations for one year, namely 2023.

### 1. Study of the Influence of Production Factors on Production

The influence of production factors (land, labor, fertilizer, and pesticides) on production could be assessed using the Cobb-Douglas Production Function via a Multiple Non-Linear Regression Test (Rank Test) according to Archontoulis and Miguez (2015) and Gujarati and Porter (2013) as follows:

$Y = b_0 X_1^{b_1} X_2^{b_2} X_3^{b_3} X_4^{b_4} e^u$  which can be linearized into

$$\log Y = \log b_0 + b_1 \log X_1 + b_2 \log X_2 + b_3 \log X_3 + b_4 \log X_4 + u$$

Description:

$Y$  = production (Kg)

$X_1$  = land area (Ha)

$X_2$  = labor (HKP)

$X_3$  = fertilizer (Kg)

$X_4$  = pesticide (liter)

$b_0$  = intercept

$b_i$  = regression coefficient

$u$  = error term

The partial effect of each independent variable ( $X_i$ ) on the dependent variable ( $Y$ ) will be known through a t-test. The test criteria used are:

- 1) If the probability value  $t_i \geq 0,05$  means that  $X_i$  partially has no significant effect on  $Y$ .
- 2) If the probability value  $t_i < 0,05$ , it means  $X_i$  has a partial significant effect on  $Y$ .

Simultaneous effect of the independent variable ( $X$ ) on the dependent variable ( $Y$ ) will be known by conducting the F Test. The test criteria used are:

- 1) If the probability value  $F \geq 0,05$  means that  $X$  simultaneously has no significant effect on  $Y$ .
- 2) If the probability value  $F < 0,05$  means that  $X$  simultaneously significantly affects  $Y$ .

The magnitude of the influence of  $X_1$ ,  $X_2$ ,  $X_3$ , and  $X_4$  on  $Y$  is known from the coefficient of determination ( $R^2$ ) value. The value of  $1 - R^2$  represents the extent of the impact from variables that are either absent from the model or not analyzed in the research.

## 2. Calculation of Technical Efficiency

Technical efficiency is calculated using the DEA (Data Envelopment Analysis) method, a non-parametric approach using a deterministic approach (linear programming). The DEA method analyzes production functions through production frontier mapping (Ferjani, 2011).

According to Coelli et.al., (2005), the TE assumption based on the Constant Returns to Scale assumption can be formulated as follows:

$$\text{Min}_{\theta, \lambda} \theta_k$$

Constraints

$$-y + Y\lambda \geq 1$$

$$\theta_{xk} - X\lambda \geq 0$$

$$\sum_{j=1}^n \lambda_j = 1$$

$$\lambda \geq 0$$

Description:

$\theta$  = Technical Efficiency Value ( $0 \leq TE \leq 1$ )

$\lambda$  = Vector weight (constant)  $N \times 1$  explaining the linear combination of DMU competitors (every  $n$  farmers)

$Y$  = Output Quantity (oil palm)

$X$  = Input Quantity (Land, Labor, Fertilizer and Pesticide)

$y$  = Output vector of DMU to  $j$  compared to the efficient DMU

$Y\lambda$  = Output at the efficient DMU

$X\lambda$  = minimum input of DMU that is theoretically efficient

The formula above shows that oil palm farmers are on an optimal scale. Banker, Charnes, and Cooper stated that not all entrepreneurs operate on an optimal scale. Therefore, they proposed technical efficiency based on the Variable Returns to Scale (VRS) assumption, often called pure technical efficiency (Pure Technical Efficiency/PTE). The VRS assumption takes into account different management practices between farmers. Adding  $\sum \lambda = 1$  to the formula above (CRS) indicates the technical efficiency frontier based on the VRS assumption.

This study uses input-oriented DEA to see how the optimal combination of inputs is based on the output produced. The VRS model (variable return to scale) is also known as pure efficiency. The VRS model is used to estimate efficiency when changes in input use do not result in proportional changes to Output. This model is carried out with the assumption that the company is not or has not yet operated at an optimal business scale. The VRS model shows increasing, constant, and decreasing yield scales (Rusydiana, 2013) in Sulistyaningsih et.al., (2019).

The results of the DEA analysis also provide information on the amount of input farmers should use to achieve a technically efficient production process. Therefore, smallholder oil palm plantation farmers must reduce the use of inputs in the future. The percentage of input reduction can be determined using the following formula:

$$\text{Percentage of input reduction (\%)} = \frac{\text{Actual Input} - \text{Target Input}}{\text{Actual Input}} \times 100 \%$$

Note:

Actual input is the input obtained from respondent farmers

Target input is the input recommended by the DEA model

## Results and Discussion

### 1. Descriptive Statistics

In this study, descriptive statistics include input-output variables consisting of input (land, labor, fertilizer, pesticide) and output (production of smallholder oil palm plantations during 2023), as presented in the following description.

**Table 1. Descriptive Statistics of Input Output Variables**

| No. | Variable<br>Input Output | Mean        | Min         | Max          | Std. Dev.   |
|-----|--------------------------|-------------|-------------|--------------|-------------|
| 1   | Land area (Ha)           | 2,6363      | 0,5600      | 7,0000       | 1,5006      |
| 2   | Labor (HKP)              | 96,9840     | 24,000      | 244,0000     | 96,9840     |
| 3   | Fertilizer (Kg)          | 623,8467    | 60,0000     | 3.540,0000   | 570,4847    |
| 4   | Pesticide (Liter)        | 12,7467     | 2,5000      | 34,0000      | 7,1954      |
| 5   | Production (kg FFB)      | 50.330,6700 | 11.600,0000 | 136.000,0000 | 28.165,1800 |

**2. Influence of Production Factors on Production**

How production factors influence the output of smallholder oil palm the plantations can be determined by conducting a Multiple Non-Linear Regression Test (Rank Test) presented in the following description.

**Table 2. Results of Multiple Non-Linear Regression Test**

| No. | Variable                     | Coefficient | Probability |
|-----|------------------------------|-------------|-------------|
| 1   | Constant                     | 7.997,0170  | 0,000*      |
| 2   | Land (X <sub>1</sub> )       | 0,7426      | 0,000*      |
| 3   | Labor (X <sub>2</sub> )      | 0,1922      | 0,000*      |
| 4   | Fertilizer (X <sub>3</sub> ) | 0,0258      | 0,000*      |
| 5   | Pesticide (X <sub>4</sub> )  | 0,0312      | 0,033*      |
| 6   | F <sub>count</sub>           | 0,0000*     |             |
| 7   | Determination Coef.          | 0,9993      |             |

Source : Primary Data Processing

Note: Significant at  $\alpha = 0,05$ 

According to the information provided in Table 2, it is possible to formulate the production function for smallholder oil palm plantations as follows:

$$Y = 7.997,0170 X_1^{0,7426} X_2^{0,1922} X_3^{0,0258} X_4^{0,0312}$$

Description:

Y = production (Kg)

X<sub>1</sub> = land (Ha)X<sub>2</sub> = labor (HKP)X<sub>3</sub> = fertilizer (Kg)X<sub>4</sub> = pesticide (Liter)**a. Partial Influence of Production Factors on Production**

Partially, the influence of production factors on production can be explained as described below.

- 1) Partially, the production of smallholder oil palm plantations is significantly positively influenced by land, as indicated by the land probability value <0.05. The wider the land farmers cultivate, the greater the production of smallholder oil palm plantations. The

findings of the study align with the findings of Adzani and Arif, (2023), Hasibuan, et al., (2022), Chaira et al., (2022), and Mini et al., (2023) but contradict the research results of Arsyad and Maryam (2017) and Alfayanti and Efendi (2013).

- 2) Partially, the production of oil palm plantations is positively influenced by labor, as indicated by the labor probability value  $<0.05$ . The greater the outpouring of labor, the greater the production of smallholder oil palm plantations. The findings of the study align with the findings of Hasibuan et al., (2022), Chaira et al., (2022), and Siswanto et al., (2020), while presenting a contradiction to the results from Yanita and Suandi (2021), Adzani and Arif (2023) and Mini et al., (2023).
- 3) Partially, the production of smallholder oil palm plantations is positively influenced by the real value indicated by the probability value of fertilizer  $<0.05$ . The greater the fertilizer use, the greater the production of smallholder oil palm plantations. The findings of the study align with the findings of Yanita and Suandi (2021), Hasibuan et al. (2022), Siswanto et al. (2020), Chaira et al. (2022) and Mini et al. (2023), while presenting a contradiction to the results from Siagian et.al., (2018) and Puruhito et.al., (2019).
- 4) Partially, the production of smallholder oil palm plantations is significantly positively influenced by pesticides, as indicated by the pesticide probability value  $<0.05$ . The greater the use of pesticides, the greater the production of smallholder oil palm plantations. The results of this study are in line with the research results of Arsyad and Maryam (2017), Mustari et al. (2020), Yanita and Suandi (2021), and Chaira et al. (2022), while presenting a contradiction to the results from Abdul et al., (2022), Welda et al., (2020), Hasibuan et al., (2022) and Chaira et al., (2022).

**b. Simultaneous Influence of Production Factors on Production**

Simultaneously, the ways in which production factors influence production can be explained as follows.

- 1) Simultaneously, the production of smallholder oil palm plantations is significantly positively influenced by land, labor, fertilizer, and pesticide production factors, as indicated by the probability value  $F < 0.05$ .
- 2) The determination coefficient, or  $R^2$  value, is 0.9993. This suggests that labor, land, fertilizer, and pesticide production factors account for 99.93% of the output of smallholder oil palm farms. Meanwhile, 0.07% of the production from smallholder oil palm plantations is impacted by other factors not examined in this study.
- 3) The rate of technical substitution (RTS) is equal to the sum of all regression coefficients, which is 0.9918. If 100% more land area, labor, fertilizer, and pesticide are used, the production process will increase by 99.18% or decrease returns to scale.

**3. Technical Efficiency Calculation**

The findings of the technical efficiency assessments are detailed in the subsequent description.

**Table 3. Technical Efficiency of Smallholder Oil Palm Plantations**

| No. | Description | Mean | Min | Max | Std. Dev. |
|-----|-------------|------|-----|-----|-----------|
|-----|-------------|------|-----|-----|-----------|

|   |                      |        |        |        |        |
|---|----------------------|--------|--------|--------|--------|
| 1 | Technical Efficiency | 0,9755 | 0,8965 | 1,0000 | 0,0228 |
|---|----------------------|--------|--------|--------|--------|

*Source: Processing of Primary Data*

Table 3 indicates that the mean technical efficiency of smallholder oil palm plantations is 0.9755, with a minimum value of 0.8965, a maximum of 1, and a standard deviation of 0.2228. That indicates that 97.55% of responding farmers can reduce input utilization while producing technically effective results. Farmers still have the opportunity to achieve a higher potential production level up to the maximum production level as obtained by farmers whose production processes are most technically efficient. The findings of this study indicate that, collectively, farmers have the potential to enhance their technical efficiency regarding technology and input by 2.45%.

The findings reveal that the technical efficiency value of smallholder oil palm plantations exceeds that of earlier research results. Notably, it surpasses the technical efficiency value of 0.8795 documented by Yahyawileonides (2022) for oil palm farming in Sanggau Regency, West Kalimantan Province. Furthermore, it exceeds the 0.70 documented by Syuhada et al., (2022) for cooperative and independent partners in West Pasaman Regency, the 0.6257 noted by Abdul et al., (2022) concerning smallholder oil palm plantations in Indonesia, and the values of 0.6789 and 0.7127 for independent and assisted farmers respectively as reported by Varina et al., (2020). Furthermore, it exceeds the 0.73 reported by Welda et al., (2020) for small-scale oil palm farming in Dharmasraya Regency, West Sumatra, and the 0.81 from Ngaisset and Jia (2020) on smallholder oil palm plantations in Lobaye, Central African Republic.

Based on the technical efficiency value calculation, the research sample can be categorized as efficient or inefficient, as presented in the following description.

**Table 4. Share Technical Efficiency Value**

| No.           | Technical Efficiency Value | Total (Sample) | Percentage (%) |
|---------------|----------------------------|----------------|----------------|
| 1             | Efficient (ET Value = 1)   | 33             | 22,00          |
| 2             | Inefficient (ET Value < 1) | 117            | 78,00          |
| <b>Amount</b> |                            | 150            | 100,00         |

*Source: Processing of Primary Data*

Table 4 illustrates that a significant portion (78.00%) of the sampled farmers exhibit a production process that lacks technical efficiency (ET Value <1), while 22.00% demonstrate a technically efficient production process (ET Value = 1).

Further DEA analysis of the production scale (rate technical substitution or RTS) based on technical efficiency shows that the production process of smallholder oil palm plantations is on a production scale, as presented in the following description.

**Table 5. Share Production Scale**

| No. | Production Scale                  | Total (Sample) | Percentage (%) |
|-----|-----------------------------------|----------------|----------------|
| 1   | IRS (Increasing Returns to Scale) | 3              | 2,00           |
| 2   | CRS (Constant Returns to Scale)   | 19             | 12,67          |
| 3   | DRS (Decreasing Returns to Scale) | 128            | 85,33          |

Amount

150

100,00

*Source: Processing of Primary Data*

Table 5 indicates that out of 150 research samples, the majority, specifically 85.33% of the production scale, is experiencing decreasing returns to scale. 12.67% of the production scale operates under constant returns to scale, while 2.00% functions under increasing returns to scale.

The technical efficiency value of smallholder oil palm the plantations indicates that many are currently operating below optimal efficiency. The DEA analysis can offer insights into the actual and target input usage, facilitating a reduction in input consumption to reach a state of technical efficiency. The description is presented in Table 6.

**Table 6. Recapitulation of Actual Input, Target Input and Input Reduction Based on Technical Efficiency Value**

| No.                    | Description       | Mean     | Min     | Max        | Std. Dev. |
|------------------------|-------------------|----------|---------|------------|-----------|
| <b>Actual Input</b>    |                   |          |         |            |           |
| 1                      | Land Area (Ha)    | 2,6363   | 0,5600  | 7,0000     | 1,5006    |
| 2                      | Labor (HKP)       | 96,9840  | 24,000  | 244,0000   | 96,9840   |
| 3                      | Fertilizer (Kg)   | 623,8467 | 60,0000 | 3.540,0000 | 570,4847  |
| 4                      | Pesticide (Liter) | 12,7467  | 2,5000  | 34,0000    | 7,1954    |
| <b>Target Input</b>    |                   |          |         |            |           |
| 1                      | Land Area (Ha)    | 2,5632   | 0,5600  | 7,0000     | 1,4577    |
| 2                      | Labor (HKP)       | 92,4925  | 24,0000 | 244,0000   | 47,6596   |
| 3                      | Fertilizer (Kg)   | 578,9966 | 60,0000 | 3540,0000  | 541,8718  |
| 4                      | Pesticide (Liter) | 12,3514  | 2,5000  | 34,0000    | 7,0011    |
| <b>Input Reduction</b> |                   |          |         |            |           |
| 1                      | Land Area (%)     | 2,5416   | 0,0000  | 10,3488    | 2,3813    |
| 2                      | Labor (%)         | 4,0501   | 0,0000  | 20,8436    | 4,6578    |
| 3                      | Fertilizer (%)    | 5,5449   | 0,0000  | 90,6271    | 10,0856   |
| 4                      | Pesticide (%)     | 3,1165   | 0,0000  | 13,0317    | 2,9722    |

*Source : Primary Data Processing*

According to Table 6, it is evident that to attain a technically efficient production process, smallholder farmers on oil palm plantations need to minimize inputs in the following ways:

Reduce land use by 2.5416% from the use during the study of an average of 2.6363 Ha.

Reduce labor use by 4.0501% from the average of 96.9840 HKP during the study.

Reduce fertilizer use by 5.5449% from the use during the study of an average of 623.8467 Kg.

Reduce pesticide use by 3.1165% from the use during the study of an average of 12.7467 Liters.

## Conclusion

Production studies using non-linear regression analysis show that all inputs (land, labor, fertilizer, and pesticides) significantly affect oil palm plantation production in the research area, partially and simultaneously. The results of the technical efficiency study show that most (78%) of farmers are not yet technically efficient. To achieve technically efficient management of smallholder oil palm plantations, farmers are given recommendations for reducing inputs for smallholder oil palm plantations that are not yet technically efficient. The average percentage of input reduction for

farmers who are not yet technically efficient is 2.5416% land, 4.0501% labor, 5.54449% fertilizer, and 3.1165% pesticide.

The government is expected to always be able to provide counseling on good oil palm farming techniques while being able to help provide production facilities needed by farmers, marketing that supports farmers, and good road infrastructure. Further researchers are expected to be able to conduct more in-depth research, especially related to economic efficiency, so that smallholder oil palm plantation farmers can obtain information on how to use input costs more efficiently in the future.

#### ABSTRAK

Efisiensi teknis perkebunan kelapa sawit rakyat adalah gambaran kemampuan petani dalam mengkoordinasi penggunaan input untuk memperoleh output yang diinginkan. Kajian ini bertujuan untuk mengetahui nilai efisiensi teknis dan faktor yang memengaruhi efisiensi teknis perkebunan kelapa sawit rakyat. Daerah penelitian ditetapkan secara purposif dengan alasan merupakan wilayah kecamatan yang memiliki luas lahan perkebunan kelapa sawit rakyat terbesar di Kabupaten Asahan sebagai wilayah kabupaten yang memiliki luas lahan perkebunan kelapa sawit terbesar Propinsi Sumatera Utara. Sampel penelitian ditentukan secara quota sampling sebesar 150 sampel yang berasal dari dua desa yaitu Desa Gonting Malaha dan Desa Padang Pulau masing-masing 75 sampel. Metode analisis data menggunakan Data Envelopment Analysis dan Analisis Regresi Censored Tobit untuk data pengelolaan perkebunan kelapa sawit rakyat selama Tahun 2023. Dari hasil penelitian diketahui bahwa sebahagian besar (81,33 %) perkebunan kelapa sawit rakyat belum efisien secara teknis, dengan nilai efisiensi teknis rata-rata adalah 0,9782. Faktor yang berpengaruh nyata pada efisiensi teknis adalah jenis kelamin, usia, pengalaman bertani, jumlah tanaman produktif yang diusahakan, jarak tempat tinggal petani ke pasar input, pengalaman petani mengaplikasikan pupuk organik, pengalaman keikutsertaan dalam organisasi petani dan pengalaman menggunakan sarana informasi dan teknologi yang terkait dengan pengelolaan usahatani. Sementara itu, faktor tingkat pendidikan, ukuran keluarga, jenis bibit yang digunakan dan akses kredit yang dilaksanakan petani berpengaruh tidak nyata terhadap efisiensi teknis.

Kata kunci: perkebunan kelapa sawit rakyat, efisiensi teknis, data envelopment analysis

#### ABSTRACT

The technical efficiency of smallholder oil palm plantations is a description of the ability of farmers to coordinate the use of inputs to obtain the desired output. This study aims to determine the value of technical efficiency and factors that influence the technical efficiency of smallholder oil palm plantations. The research area was determined purposively on the grounds that it is a sub-district area that has the largest area of smallholder oil palm plantations in Asahan Regency as the regency area with the largest area of oil palm plantations in North Sumatra Province. The research sample was determined by quota sampling of 150 samples from two villages, namely Gonting Malaha Village and Padang Pulau Village, each with 75 samples. The data analysis method used Data Envelopment Analysis and Censored Tobit Regression Analysis for data on the management of smallholder oil palm plantations during 2023. From the results of the study, it is known that the majority (81.33%) of smallholder oil palm plantations are not yet technically efficient, with an average technical efficiency value of 0.9782. Factors that significantly influence technical efficiency are gender, age, farming experience, number of productive plants cultivated, distance from farmer's residence to input market, farmer's experience in applying organic fertilizer, experience in participating in farmer organizations and experience in using information and technology facilities related to farming management. Meanwhile, factors of education level, family size, type of seeds used and access to credit implemented by farmers have no significant effect on technical efficiency.

Keywords: smallholder oil palm plantations, technical efficiency, data envelopment analysis

## PENDAHULUAN

Perkebunan kelapa sawit di Indonesia terdiri dari tiga status perusahaan yaitu perkebunan besar milik negara, perkebunan besar milik swasta serta perkebunan rakyat. Data Direktorat Jenderal Perkebunan (2024) menunjukkan bahwa luas lahan perkebunan kelapa sawit di Indonesia pada Tahun 2023 adalah 15.435.656 hektar yang terdiri dari 40,76 % perkebunan rakyat, 3,53 % perkebunan besar milik negara dan 55,71 % perkebunan besar milik swasta. Pada masa yang akan datang di Indonesia diperkirakan bahwa luas lahan perkebunan kelapa sawit rakyat akan mendominasi luas lahan perkebunan kelapa sawit secara nasional, oleh karena itu kontribusi perkebunan kelapa sawit rakyat akan terus meningkat terhadap pembangunan perkebunan kelapa sawit dan pembangunan ekonomi Indonesia.

Pada Tahun 2023, berdasarkan luas lahan perkebunan kelapa sawit rakyat posisi Propinsi Sumatera Utara menempati urutan kelima terbesar di Indonesia, yang lahannya berada di 22 kabupaten/kota dengan luas lahan 488.414 hektar. Sebagian besar lahan perkebunan rakyat di Propinsi Sumatera Utara berada di wilayah Pantai Timur menyusul Pantai Barat Dataran Tinggi serta Kepulauan Nias (Direktorat Jenderal Perkebunan, 2024).

Kinerja perkebunan rakyat yang diukur dari produktivitas ternyata masih berada di bawah perkebunan besar (baik milik swasta maupun milik negara). Masalah utama yang terjadi pada perkebunan kelapa sawit rakyat adalah masih rendahnya produktivitas tanaman. Hal tersebut diakibatkan oleh lemahnya tindakan pengelolaan perkebunan, di mana petani memiliki pengetahuan/keterampilan serta kemampuan teknis budidaya yang masih rendah serta kurangnya penguasaan modal oleh petani. Kesenjangan produktivitas antara perkebunan kelapa sawit rakyat dan perkebunan besar swasta relatif cukup tinggi yaitu sebesar 7 - 20 ton TBS/ha/tahun atau berkisar 41 - 64 % (Suharno et.al., 2015).

Upaya peningkatan produktivitas efisiensi pada perkebunan rakyat akan menjadi sangat penting dan memiliki dampak yang besar terhadap peningkatan produktivitas dan efisiensi perkebunan di Indonesia. Hal tersebut diakibatkan oleh karena kontribusi produksi perkebunan rakyat yang tinggi terhadap produksi perkebunan nasional (Setiyanto, 2015).

Menurut Sasongko (2010), bahwa keberhasilan budidaya suatu jenis tanaman dipengaruhi oleh varietas tanaman yang diusahakan, agroekologi atau lingkungan tempat tumbuh serta tindakan pengelolaan yang dilakukan oleh petani/pengusaha tani. Produksi usahatani dihasilkan melalui serangkaian kegiatan yang disebut proses produksi. Proses produksi usahatani merupakan serangkaian upaya yang dilakukan dalam pengaturan faktor produksi dalam menghasilkan produksi usahatani (Arifin, 2015). Faktor produksi usahatani atau sering disebut sebagai unsur-unsur pokok usahatani adalah merupakan faktor utama yang dibutuhkan dalam usahatani dan merupakan input dalam proses produksi usahatani. Menurut , proses produksi dapat berlangsung apabila telah memenuhi persyaratan yang dibutuhkan, persyaratan tersebut dikenal dengan faktor produksi. Faktor produksi usahatani terdiri dari empat unsur yaitu lahan, tenaga kerja, modal dan manajemen.

Pengelolaan usahatani yang tepat sangat dibutuhkan dalam upaya peningkatan produksi usahatani. Pengelolaan usahatani yang dimaksud adalah kemampuan petani untuk melakukan koordinasi penggunaan faktor produksi sebaik-baiknya serta juga mampu menghasilkan produksi usahatani yang diharapkan. Menurut Nguyen et.al., (2018) bahwa pengukuran dan kajian efisiensi produksi usahatani merupakan salah satu cara untuk mengetahui tingkat penggunaan input (kombinasi input) yang dilakukan oleh pengusahatani dalam menghasilkan output sekaligus upaya yang dapat dilakukan untuk meningkatkan efisiensi. Masih rendahnya produktivitas perkebunan kelapa sawit rakyat di Indonesia termasuk di Propinsi Sumatera Utara menunjukkan bahwa efisiensi produksi perkebunan kelapa sawit juga masih rendah.

Terdapat banyak faktor yang memengaruhi efisiensi produksi usahatani. Van Passel et al., (2007) menjelaskan bahwa faktor-faktor yang memengaruhi efisiensi produksi usahatani adalah sebagai berikut :

1. Faktor perantara (*agent factors*) meliputi pendidikan, umur, pengalaman dan lain-lain.
2. Faktor struktural (*structural factors*) yang terdiri dari:
  - a. Faktor internal usahatani (*on farm factors*) meliputi lokasi usahatani, tipe usahatani, ukuran usahatani dan lain-lain.
  - b. Faktor di luar usahatani (*off farm factors*) meliputi hubungan organisasi usahatani (*up-down*

*stream relation*), kebijakan dan lain-lain.

Kajian efisiensi produksi perkebunan kelapa sawit rakyat bertujuan untuk penggunaan sumberdaya yang lebih baik dan mengurangi terjadinya pemborosan penggunaan sumberdaya untuk pengusahaan perkebunan kelapa sawit rakyat yang lebih baik pada masa yang akan datang. Kajian yang dilakukan ini bertujuan untuk mengetahui nilai efisiensi teknis serta mengetahui faktor yang memengaruhi efisiensi teknis perkebunan kelapa sawit rakyat di Kecamatan Bandar Pulau Kabupaten Asahan Propinsi Sumatera Utara.

## METODE PENELITIAN

Daerah penelitian ditetapkan secara purposif (sengaja) dengan pertimbangan bahwa menurut data BPS Propinsi Sumatera Utara (2024) dan BPS Kabupaten Asahan (2024), bahwa Kecamatan Bandar Pulau merupakan wilayah kecamatan yang memiliki luas lahan perkebunan kelapa sawit rakyat terbesar di Kabupaten Asahan, dan Kabupaten Asahan adalah wilayah kabupaten dengan luas lahan perkebunan kelapa sawit rakyat terbesar di Propinsi Sumatera Utara. Sampel penelitian ditentukan secara *Quota Sampling* sebanyak 150 petani perkebunan kelapa sawit rakyat yang berasal dari 2 desa di Kecamatan Bandar Pulau yaitu Desa Gonting Malaha dan Desa Padang Pulau masing-masing sebanyak 75 sampel. Data penelitian adalah berupa data primer yang diperoleh secara langsung dari petani dengan melakukan wawancara menggunakan daftar pertanyaan (kuesioner) yang telah dipersiapkan terlebih dahulu, meliputi data pengelolaan perkebunan kelapa sawit rakyat selama satu tahun yaitu Tahun 2023.

### 1. Perhitungan Efisiensi Teknis

Perhitungan efisiensi teknis dilakukan dengan metode *Data Envelopment Analysis* (DEA). Metode DEA adalah pendekatan secara non parametrik menggunakan pendekatan deterministik (*linear programming*) dalam menganalisis fungsi produksi dengan cara pemetaan frontier produksi (Ferjani, 2011).

Menurut Coelli et.al., (2005), nilai efisiensi teknis (TE) berdasarkan asumsi *Constant Returns to Scale* (CRS) dapat diformulasikan sebagai berikut :

$$\begin{aligned} & \text{Min}_{\theta, \lambda} \theta_k \\ & \text{Kendala} \\ & -y + Y\lambda \geq 1 \\ & \theta_k x_j - X\lambda \geq 0 \\ & \sum \lambda_j = 1 \\ & \lambda \geq 0 \end{aligned}$$

Keterangan:

$\theta$  = Nilai Efisiensi Teknis ( $0 \leq TE \leq 1$ )

$\lambda$  = Bobot vektor (konstan)  $N \times 1$  menjelaskan kombinasi linear dari pesaing DMU (setiap  $n$  petani)

$Y$  = Kuantitas Output (kelapa sawit)

$X$  = Kuantitas input (Lahan, Tenaga Kerja, Pupuk dan Pestisida)

$y$  = Vektor output DMU ke  $j$  dibandingkan pada DMU yang efisien

$Y\lambda$  = Output pada DMU yang efisien

$X\lambda$  = minimum input DMU yang efisien secara teoritis

Rumus di atas menunjukkan bahwa petani kelapa sawit berada pada skala optimal. Banker, Charnes dan Cooper menyatakan tidak semua pengusaha beroperasi berada pada skala optimal. Oleh karena itu, mereka mengusulkan efisiensi teknis berdasarkan asumsi *Variable Returns to Scale* (VRS) atau disebut juga efisiensi teknis *murni* (*Pure Technical Efficiency*/PTE). Asumsi VRS mempertimbangkan praktek manajemen yang berbeda antara petani. Penambahan  $\sum \lambda = 1$  pada rumus di atas (CRS) menjadi petunjuk pada batas (frontier) efisiensi teknis berdasarkan asumsi VRS.

Penelitian ini menggunakan metode DEA yang berorientasi input karena penelitian ini ingin melihat bagaimana kombinasi input yang optimal berdasarkan output yang dihasilkan. Model yang

digunakan adalah model VRS dalam memperkirakan efisiensi ketika perubahan penggunaan input (peningkatan atau penurunan) tidak mengakibatkan perubahan output secara proporsional. Dalam penggunaan model VRS dianggap bahwa perusahaan tidak atau belum beroperasi pada skala yang optimal. Dengan demikian, model VRS dapat memperlihatkan skala hasil yang meningkat, konstan, dan menurun (Rusydiana, 2013 dalam Sulistyaningsih et.al., (2019).

Hasil Analisis DEA juga memberikan informasi tentang jumlah input yang seharusnya digunakan petani untuk mencapai proses produksi yang efisien secara teknis. Oleh karena itu petani perkebunan kelapa sawit rakyat harus melakukan pengurangan penggunaan input untuk masa yang akan datang. Presentase pengurangan input tersebut dapat diketahui dengan rumus sebagai berikut:

$$\text{Presentase pengurangan input (\%)} = \frac{\text{Input Aktua} - \text{Target Input}}{\text{Input Aktual}} \times 100 \%$$

Keterangan:

Input aktual adalah input yang didapatkan dari petani responden

Target input adalah input yang dianjurkan oleh model DEA

## 2. Faktor yang Memengaruhi Efisiensi Teknis

Pengaruh faktor yang memengaruhi efisiensi teknis dapat dilihat dengan melakukan Uji Regresi *Censored Tobit*. Asumsi dalam Metode *Censored Tobit* adalah bahwa semua variabel bebas yang digunakan mempunyai nilai yang tidak terbatas (*non-censored*), oleh karena itu hanya variabel terikat yang *censored*. Semua variabel bebas maupun terikat dapat diukur dengan benar di mana tidak terjadi autokorelasi, tidak terjadi heteroskedastisitas, serta tidak terjadi multikolinearitas yang sempurna, dengan demikian maka model matematis yang digunakan menjadi tepat (Lin et.al., 2022).

Fungsi Regresi Tobit dalam penelitian ini dapat dituliskan sebagaimana menurut (Amemiya, 1984) sebagai berikut :

$$EF = b_0 + b_1X_1 + b_2X_2 + \dots + \dots + b_{12}X_{12} + e$$

Keterangan :

EF = Skor efisiensi teknis yang diperoleh dari DEA

$b_0$  = Titik Potong (intercept)

$b_1$ - $b_{12}$  = Koefisien Regresi

$X_1$  = Jenis Kelamin Petani (0 = Wanita ; 1 = Pria)

$X_2$  = Usia Petani (tahun)

$X_3$  = Tingkat Pendidikan Petani (tahun)

$X_4$  = Pengalaman Bertani Petani (tahun)

$X_5$  = Ukuran Keluarga Petani (jiwa)

$X_6$  = Jenis Bibit Yang Digunakan Petani (0 = tidak bersertifikat ; 1 = bersertifikat)

$X_7$  = Jumlah Tanaman Produktif Yang Diusahakan Petani (pokok)

$X_8$  = Akses Kredit Yang Dilaksanakan Petani (0 = tidak ada ; 1 = ada)

$X_9$  = Jarak Tempat Tinggal Petani ke Pasar Input (km)

$X_{10}$  = Pengalaman Petani Mengaplikasikan Pupuk Organik (tahun)

$X_{11}$  = Pengalaman Keikutsertaan Petani Dalam Organisasi Petani (tahun)

$X_{12}$  = Pengalaman Petani Dalam Penggunaan Sarana Informasi dan Teknologi yang Terkait Dengan Pengelolaan Usahatani (tahun)

Pengaruh secara parsial variabel bebas ( $X_i$ ) terhadap variabel terikat (Y) dapat diketahui dengan melakukan Uji Z. Kriteria pengujian yang digunakan adalah:

1. Apabila nilai probabilitas  $Z \geq 0,05$  maka secara parsial variabel bebas  $X_i$  berpengaruh tidak nyata terhadap variabel terikat Y.
2. Apabila nilai probabilitas  $Z < 0,05$  maka secara parsial variabel bebas  $X_i$  berpengaruh nyata terhadap variabel terikat Y.

Pengaruh secara simultan variabel bebas ( $X_i$ ) secara simultan terhadap variabel terikat ( $Y$ ) dapat diketahui dengan melakukan Uji Rasio Likelihood atau Uji G dengan kriteria pengujian sebagaimana menurut Upaya (2021) sebagai berikut :

1. Apabila nilai probabilitas rasio likelihood  $\geq 0,05$  maka secara simultan semua variabel bebas  $X_i$  berpengaruh tidak nyata terhadap variabel terikat  $Y$ .
2. Apabila nilai probabilitas rasio likelihood  $< 0,05$  maka secara simultan semua variabel bebas  $X_i$  berpengaruh nyata terhadap  $Y$ .

Besarnya pengaruh variabel bebas  $X_i$  ( $X_1, X_2, \dots, X_{12}$ ) terhadap variabel terikat  $Y$  diketahui dari besarnya nilai koefisien determinasi ( $R^2$ ). Nilai  $1 - R^2$  merupakan besarnya pengaruh variabel lainnya yang tidak diikutkan dalam model regresi atau tidak termasuk sebagai variabel penelitian.

## HASIL DAN PEMBAHASAN

### 1. Statistik Deskriptif

Analisis deskriptif data penelitian meliputi analisis deskriptif variabel input output dan analisis deskriptif variabel faktor sosial ekonomi petani.

#### a. Analisis Deskriptif Variabel Input Output

Variabel input output dalam kajian ini adalah luas lahan, tenaga kerja, pupuk, pestisida dan produksi perkebunan kelapa sawit rakyat di Kecamatan Bandar Pulau selama Tahun 2023 seperti uraian berikut ini.

**Tabel 1. Statistik Deskriptif Variabel Input Output**

| No. | Variabel Input Output | Mean      | Min    | Max    | Std. Dev.  |
|-----|-----------------------|-----------|--------|--------|------------|
| 1   | Luas Lahan (Ha)       | 2,7785    | 0,6    | 6,8    | 1,3689     |
| 2   | Tenaga Kerja (HKP)    | 117,1473  | 27     | 240    | 50,0840    |
| 3   | Pupuk (Kg)            | 997,8200  | 90     | 3.640  | 638,9202   |
| 4   | Pestisida (Liter)     | 14,1900   | 3      | 34     | 6,6298     |
| 5   | Produksi (kg TBS)     | 58.259,33 | 12.800 | 14.000 | 28.011,000 |

Sumber: Pengolahan Data Primer

#### b. Analisis Deskriptif Variabel Yang Memengaruhi Efisiensi Teknis

Variabel yang memengaruhi efisiensi teknis dalam kajian ini terdiri dari jenis kelamin petani, umur petani, pendidikan petani, pengalaman bertani petani, ukuran keluarga petani, jenis bibit yang digunakan petani, jumlah tanaman produktif yang diusahakan petani, akses kredit yang dilaksanakan petani, jarak tempat tinggal petani ke pasar input, pengalaman petani mengaplikasikan pupuk organik, pengalaman keikutsertaan petani dalam organisasi petani dan pengalaman petani dalam penggunaan sarana informasi dan teknologi yang terkait dengan pengelolaan usahatani seperti dapat dilihat berikut ini.

**Tabel 2. Statistik Deskriptif Variabel Yang Memengaruhi Efisiensi Teknis**

| No. | Variabel Faktor Sosial Ekonomi           | Mean     | Min | Max | Std. Dev. |
|-----|------------------------------------------|----------|-----|-----|-----------|
| 1   | J. Kelamin (0 = wanita ; 1 = pria)       | 0,6267   | 0   | 1   | 0,4853    |
| 2   | Umur (Tahun)                             | 52,8133  | 40  | 64  | 6,0550    |
| 3   | Pendidikan (tahun)                       | 12,2133  | 9   | 17  | 1,8987    |
| 4   | Pengalaman Bertani (Tahun)               | 21,3733  | 12  | 35  | 5,5835    |
| 5   | Ukuran Keluarga (Jiwa)                   | 5,6000   | 4   | 7   | 0,8514    |
| 6   | Jenis Bibit (0 = asalan ; 1 = sertifica) | 0,6133   | 0   | 1   | 0,4886    |
| 7   | Jumlah Tanaman (Pokok)                   | 397,4200 | 85  | 990 | 196,6687  |
| 8   | Akses Kredit (0 = Tidak Ada ; 1 = A      | 0,4400   | 0   | 1   | 0,4980    |
| 9   | Jarak ke Pasar Input (Km)                | 2,6013   | 1,4 | 3,9 | 0,5299    |
| 10  | Aplikasi Pupuk Organik (Tahun)           | 2,0867   | 0   | 7   | 2,2995    |

## 2. Perhitungan Efisiensi Teknis

Hasil perhitungan nilai efisiensi teknis dengan metode *Data Envelopment Analysis* perkebunan kelapa sawit rakyat tersaji pada Tabel 3.

**Tabel 3. Nilai Efisiensi Teknis**

| No. | Uraian           | Mean   | Min | Max    | Std. Dev. |
|-----|------------------|--------|-----|--------|-----------|
| 1   | Efisiensi Teknis | 0,9782 | 4   | 1,0000 | 0,0174    |

Sumber: Pengolahan Data Primer

Dari informasi yang tersaji pada Tabel 3 terlihat besarnya nilai rata-rata efisiensi teknis perkebunan kelapa sawit rakyat adalah 0,9782 dengan nilai minimal 0,9094, maksimal 1 dan standar deviasi 0,0174. Dengan demikian dapat dikemukakan bahwa kemampuan petani responden dalam meminimalkan penggunaan input untuk memperoleh output yang efisien secara teknis adalah 97,82 %. Oleh karena itu, masih terdapat peluang untuk memperoleh hasil maksimal seperti yang dicapai petani paling efisien secara teknis. Hasil penelitian mengindikasikan bahwa masih terdapat peluang bagi petani secara keseluruhan untuk melakukan peningkatan nilai efisiensi teknis dengan teknologi dan input yang ada sebesar 2,18 %.

Berdasarkan perhitungan nilai efisiensi teknis, maka sampel penelitian dapat dikategorikan efisien dan tidak efisien seperti tersaji pada Tabel 4.

**Tabel 4. Share Nilai Efisiensi Teknis**

| No.           | Kategori Efisiensi Teknis    | Jumlah (Sampel) | Persentase (%) |
|---------------|------------------------------|-----------------|----------------|
| 1             | Efisien (Nilai ET = 1)       | 28              | 18,67          |
| 2             | Tidak Efisien (Nilai ET < 1) | 122             | 81,33          |
| <b>Jumlah</b> |                              | <b>150</b>      | <b>100,00</b>  |

Sumber: Pengolahan Data Primer

Dari informasi yang tersaji pada Tabel 4 terlihat bahwa sebahagian besar (81,33 %) petani sampel memiliki proses produksi yang belum efisien secara teknis (Nilai ET < 1) dan 18,67 % petani sampel memiliki proses produksi yang efisien secara teknis (Nilai ET = 1).

Analisis DEA selanjutnya tentang skala produksi (*rate technical substitution* atau RTS) berdasarkan efisiensi teknis menunjukkan bahwa proses produksi perkebunan kelapa sawit rakyat berada pada beberapa skala produksi seperti tersaji pada Tabel 5.

**Tabel 5. Share Skala Produksi Berdasarkan Analisis Efisiensi Teknis**

| No.           | Skala Produksi                           | Jumlah (Sampel) | Persentase (%) |
|---------------|------------------------------------------|-----------------|----------------|
| 1             | <i>Increasing Returns to Scale (IRS)</i> | 38              | 25,33          |
| 2             | <i>Constant Returns to Scale (CRS)</i>   | 3               | 2,00           |
| 3             | <i>Decreasing Returns to Scale (DRS)</i> | 109             | 72,67          |
| <b>Jumlah</b> |                                          | <b>150</b>      | <b>100,00</b>  |

Sumber: Pengolahan Data Primer

Dari informasi yang tersaji pada Tabel 5 terlihat bahwa dari 150 sampel penelitian maka sebahagian besar atau 72,67 % skala produksinya berada pada *decreasing returns to scale*. Sebesar 2,00 % skala produksinya berada pada *constant returns to scale* dan 25,33 % skala produksinya berada pada *increasing returns to scale*.

Berdasarkan nilai efisiensi teknis perkebunan kelapa sawit rakyat yang sebahagian besar belum efisien maka dari Analisis DEA selanjutnya dapat diketahui informasi tentang penggunaan input

aktual dan target input serta pengurangan penggunaan input untuk mencapai keadaan yang efisien secara teknis. Uraian tersebut tersaji pada Tabel 6.

**Tabel 6. Rekapitulasi Input Aktual, Target Input dan Pengurangan Input Berdasarkan Nilai Efisiensi Teknis**

| No. | Uraian                   | Mean     | Min | Max     | Std. Dev. |
|-----|--------------------------|----------|-----|---------|-----------|
|     | <b>Input Aktual</b>      |          |     |         |           |
| 1   | Lahan (Ha)               | 2,7785   | 0,6 | 6,8     | 1,3689    |
| 2   | Tenaga Kerja (HKP)       | 117,1473 | 27  | 240     | 50,0840   |
| 3   | Pupuk (Kg)               | 997,8200 | 90  | 3.640   | 638,9202  |

### 3. Faktor yang Memengaruhi Efisiensi Teknis

Pada kajian ini, faktor yang diduga berpengaruh terhadap efisiensi teknis perkebunan kelapa sawit rakyat meliputi jenis kelamin petani ( $X_1$ ), umur petani ( $X_2$ ), pendidikan petani ( $X_3$ ), pengalaman bertani ( $X_4$ ), ukuran keluarga petani ( $X_5$ ), jenis bibit yang digunakan petani ( $X_6$ ), jumlah tanaman produktif yang diusahakan petani ( $X_7$ ), akses kredit yang dilaksanakan petani ( $X_8$ ), jarak tempat tinggal petani ke pasar input ( $X_9$ ), pengalaman petani mengaplikasikan pupuk organik ( $X_{10}$ ), pengalaman keikutsertaan petani dalam organisasi petani ( $X_{11}$ ) dan pengalaman petani dalam penggunaan sarana informasi dan teknologi yang terkait dengan pengelolaan usahatani ( $X_{12}$ ). Pengaruh variabel bebas (faktor sosial ekonomi petani) terhadap variabel terikat (efisiensi teknis) diketahui dari hasil Uji Regresi *Censored* Tobit seperti tersaji pada Tabel 7.

**Tabel 7. Hasil Uji Regresi *Censored* Tobit**

| No. | Variabel                                | Koefisien | Probability<br>Z | Std. Error |

#### a. Pengaruh Secara Parsial Faktor Yang Memengaruhi Efisiensi Teknis

Berdasarkan hasil Uji Regresi *Censored* Tobit yang tersaji pada Tabel 7 maka penjelasan tentang pengaruh secara parsial faktor yang memengaruhi efisiensi teknis perkebunan kelapa sawit rakyat dapat dijelaskan sebagai berikut :

- 1) Secara parsial jenis kelamin petani berpengaruh negatif yang nyata terhadap efisiensi teknis, di mana efisiensi teknis perkebunan rakyat yang dikelola petani berjenis kelamin wanita lebih tinggi dibanding efisiensi teknis perkebunan rakyat yang dikelola petani berjenis kelamin pria. Hasil kajian sesuai dengan hasil penelitian Mengui et.al., (2019) tetapi bertentangan dengan hasil penelitian , Danso-Abbeam et.al., (2020) dan Effendy et al., (2019).
- 2) Secara parsial usia petani berpengaruh positif yang nyata terhadap efisiensi teknis, di mana semakin tinggi umur petani maka efisiensi teknis perkebunan rakyat yang dikelolanya semakin tinggi. Hasil kajian sesuai dengan hasil penelitian Varina et al., (2020), Bankole et.al., (2018) dan Ngaisset and Jia (2020), tetapi bertentangan dengan hasil penelitian Syuhada et.al., (2022) dan Ariyanto et.al., (2020).
- 3) Secara parsial tingkat pendidikan petani berpengaruh tidak nyata terhadap efisiensi teknis. Efisiensi teknis perkebunan kelapa sawit rakyat tidak menunjukkan perbedaan yang nyata berdasarkan tingkat pendidikan petani. Hasil kajian sesuai dengan hasil penelitian Tenaye (2020), Varina et.al., (2020), Abdul et.al., (2022), dan Alwarritzi et.al., (2015), tetapi bertentangan dengan hasil penelitian Syuhada et.al., (2022) dan Ngaisset and Jia (2020).
- 4) Secara parsial pengalaman bertani petani berpengaruh negatif yang nyata terhadap efisiensi teknis, di mana semakin banyak pengalaman bertani petani maka efisiensi teknis perkebunan rakyat yang dikelolanya semakin rendah. Hasil kajian sesuai dengan hasil penelitian Maryanto et.al., (2018), tetapi bertentangan dengan hasil penelitian Damayanti et.al., (2023), Simatupang et.al., (2024), dan Ngaisset and Jia (2020).
- 5) Secara parsial ukuran keluarga petani berpengaruh tidak nyata terhadap efisiensi teknis. Efisiensi teknis perkebunan kelapa sawit rakyat tidak menunjukkan perbedaan yang nyata berdasarkan ukuran keluarga petani. Hasil kajian sesuai dengan hasil penelitian Simatupang et.al., (2024), tetapi bertentangan dengan hasil penelitian Tenaye (2020) dan Tanko et.al., (2019).
- 6) Secara parsial jenis bibit yang digunakan petani berpengaruh tidak nyata terhadap efisiensi teknis. Efisiensi teknis perkebunan kelapa sawit rakyat tidak menunjukkan perbedaan yang nyata berdasarkan jenis bibit yang digunakan. Hasil kajian bertentangan dengan hasil penelitian Abdul et al., (2022), Dalheimer et.al., (2021), Syuhada et.al., (2022) dan Welda et.al., (2020).
- 7) Secara parsial jumlah tanaman produktif yang diusahakan petani secara parsial berpengaruh positif yang nyata terhadap efisiensi teknis, di mana semakin besar jumlah tanaman produktif yang diusahakan petani maka efisiensi teknis perkebunan rakyat yang dikelolanya semakin tinggi. Hasil kajian sejalan dengan hasil penelitian Ismiasih and Afroda (2023) dan Welda et.al., (2020) tetapi bertentangan dengan hasil penelitian Mustari et.al., (2020) dan Chaira et.al., (2022).
- 8) Secara parsial akses kredit yang dilaksanakan petani berpengaruh tidak nyata terhadap efisiensi teknis. Efisiensi teknis perkebunan kelapa sawit rakyat tidak menunjukkan perbedaan yang nyata berdasarkan akses kredit yang dilaksanakan petani. Hasil kajian sejalan dengan hasil penelitian Abdul et al., (2022) dan Simatupang et.al., (2024), tetapi bertentangan dengan hasil penelitian Imran et al., (2019) dan Ngaisset and Jia (2020).
- 9) Secara parsial jarak tempat tinggal petani ke pasar input secara berpengaruh negatif yang nyata terhadap efisiensi teknis, di mana semakin jauh jarak tempat tinggal petani ke pasar input maka efisiensi teknis perkebunan rakyat yang dikelolanya semakin rendah. Hasil kajian sejalan dengan hasil penelitian Teferra et.al., (2018), tetapi bertentangan dengan hasil penelitian Martey (2019).
- 10) Secara parsial pengalaman petani mengaplikasikan pupuk organik berpengaruh negatif yang nyata terhadap efisiensi teknis, di mana semakin banyak pengalaman petani mengaplikasikan pupuk organik maka efisiensi teknis perkebunan rakyat yang dikelolanya semakin rendah. Hasil kajian sesuai dengan hasil penelitian Chau and Ahamed (2022), tetapi bertentangan dengan hasil penelitian Salam et.al., (2021) dan Syuhada et.al., (2022).
- 11) Secara parsial pengalaman keikutsertaan petani dalam organisasi petani berpengaruh positif yang nyata terhadap efisiensi teknis, di mana semakin banyak pengalaman keikutsertaan petani dalam

organisasi petani maka efisiensi teknis perkebunan kelapa sawit rakyat yang dikelolanya semakin tinggi. Hasil kajian sejalan dengan hasil penelitian Varina et al., (2020) dan Alwarritzi et al., (2015), tetapi bertentangan dengan hasil penelitian Hikmasari et.al., (2013) dan Lubis et.al., (2014).

- 12) Secara parsial pengalaman petani dalam penggunaan sarana informasi dan teknologi yang terkait dengan pengelolaan usahatani berpengaruh positif yang nyata terhadap efisiensi teknis, di mana semakin banyak pengalaman petani dalam penggunaan sarana informasi dan teknologi yang terkait dengan pengelolaan usahatani maka efisiensi teknis perkebunan kelapa sawit rakyat yang dikelolanya semakin tinggi. Hasil kajian sejalan dengan hasil penelitian (Safitri et al., 2021) dan Darmayanti et.al., (2022), tetapi bertentangan dengan hasil penelitian Chau and Ahamed (2022).

#### b. Pengaruh Secara Simultan Faktor Yang Memengaruhi Efisiensi Teknis

Secara simultan, faktor yang yang memengaruhi efisiensi teknis berpengaruh nyata terhadap efisiensi teknis perkebunan kelapa sawit rakyat. Hasil perhitungan menghasilkan nilai koefisien determinasi ( $R^2$ ) sebesar 0,3536. Dengan demikian, faktor yang memengaruhi efisiensi teknis berpengaruh sebesar 35,36 % terhadap efisiensi teknis perkebunan kelapa sawit rakyat, dan 64,54 dipengaruhi faktor lainnya yang tidak dimasukkan dalam model regresi atau tidak menjadi variabel penelitian dalam kajian ini.

### KESIMPULAN

Dari hasil kajian dan pembahasan yang telah dilakukan sebelumnya maka dapat ditarik beberapa kesimpulan sebagai berikut :

- Sebagian besar (81,33 %) perkebunan kelapa sawit rakyat di Kecamatan Bandar Pulau Kabupaten Asahan Propinsi Sumatera Utara belum efisien secara teknis, dengan nilai rata-rata efisiensi teknis sebesar 0,9782.
- Upaya untuk mencapai proses produksi yang efisien secara teknis, maka petani perkebunan rakyat harus mengadakan pengurangan penggunaan input yaitu lahan 2,2049 %, tenaga kerja 2,4864 %, pupuk 8,7110 % dan pestisida 3,5071 %.
- Faktor jenis kelamin, umur, pengalaman bertani, jumlah tanaman produktif yang diusahakan, jarak tempat tinggal petani ke pasar input, pengalaman petani mengaplikasikan pupuk organik, pengalaman keikutsertaan dalam organisasi petani dan pengalaman menggunakan sarana informasi dan teknologi yang terkait dengan pengelolaan usahatani berpengaruh nyata terhadap efisiensi teknis perkebunan kelapa sawit rakyat. Sementara itu, faktor pendidikan, ukuran keluarga, jenis bibit yang digunakan dan akses kredit yang dilaksanakan petani berpengaruh tidak nyata terhadap efisiensi teknis perkebunan kelapa sawit rakyat.

### Abstract

This study was conducted to analyse the economic efficiency of smallholder oil palm plantations and the socioeconomic factors that affect them. The study area was purposively selected because it is the sub-district with the largest area of smallholder oil palm plantations in Padang Lawas Regency, with the largest area of smallholder oil palm plantations on the West Coast of North Sumatra Province. The study sample was determined using quota sampling, with 150 samples drawn from Aek Lancat Village and Pagaran Mompang Village, each with 75 samples. Data analysis methods used: Data Envelopment Analysis and Censored Tobit Regression Analysis for smallholder oil palm plantation management data for 2023. The results showed that the majority (85.33%) of smallholder oil palm plantations were not economically efficient, with an average economic efficiency value of 0.8789. Factors such as gender, farming experience, family size, type of seed used, distance from the farmer's residence to the input market, and experience in applying organic fertiliser significantly affected the economic efficiency of smallholder oil palm plantations. Meanwhile, socioeconomic factors such as age, education, the number of productive oil palm plants cultivated, access to credit, experience in participating in farmer organisations, and farmers' experience in using information and technology facilities related to farming management have no significant effect on the economic efficiency of smallholder oil palm plantations.

**Keywords:** Economic Efficiency, Smallholder Oil Palm Plantations, Socioeconomic Factors

### Introduction

Oil palm has become the most prominent plantation commodity, making a significant contribution to Indonesia's economic activity. That is because the vegetable oil produced from oil palm fruit can be processed into essential materials, both in the form of semi-finished products and finished products, by the industrial sector (agro-industry). Indonesia is currently the world's largest producer of palm oil. Data from 2022 shows that oil palm plantations in Indonesia cover 16.38 million hectares, with a production level reaching 46.8 million tons of CPO. The palm oil business plays a significant role in the national economy, as evidenced by various aspects, including the employment of over 16 million workers. The palm oil agro-industry has also endeavoured to create energy independence, using biodiesel as a substitute for fossil fuels, reaching 9.3 million tons in 2020, and as a source of electrical energy, at 1,829 MW. The palm oil agribusiness will

continue to be a key contributor to Indonesia's trade balance performance, accounting for 13.50% of non-oil and gas exports or 3.50% of Indonesia's total GDP (Kementerian Pertanian, 2022).

The types and status of oil palm plantations in Indonesia include large state-owned plantations, large private plantations, and smallholder plantations. Data from the Direktorat Jenderal Perkebunan (2024) indicate that the total area of oil palm plantations in Indonesia in 2023 was 15,435,656 hectares, comprising 40.76% smallholder plantations, 3.53% large state-owned plantations, and 55.71% large private plantations. In the future, smallholder oil palm plantations are projected to account for the largest area of oil palm plantations in Indonesia. Therefore, their contribution to Indonesia's economic development is expected to continue to increase.

According to data from the Direktorat Jenderal Perkebunan (2024), North Sumatra Province is expected to have the third-largest area of oil palm plantations and the fifth-largest area of smallholder oil palm plantations in Indonesia. Smallholder oil palm plantations in North Sumatra Province are spread across 22 regencies/cities, covering the East Coast, West Coast, Highlands, and Nias Islands. By 2023, the area of smallholder oil palm plantations in North Sumatra Province is expected to reach 488,414 hectares, primarily located on the east coast.

To date, the performance of smallholder oil palm plantations, measured by productivity, remains below that of large privately owned and state-owned plantations. The primary problem with smallholder oil palm plantations is low crop productivity due to inadequate management practices. The productivity gap between smallholder oil palm plantations and large plantations remains relatively large, ranging from 41% to 64%, or 7-20 tons of fresh fruit bunches (FFB) per hectare per year (Suharno et al., 2015).

Therefore, to increase palm oil production in Indonesia, efforts to improve the productivity and efficiency of smallholder oil palm plantations are crucial. The significant contribution of smallholder oil palm plantations to national oil palm production means that increased efficiency in smallholder plantations will have a substantial impact on national plantation production efficiency (Setiyanto, 2015).

Increasing farm production requires appropriate management practices. Farm management refers to the ability of farmers to optimally coordinate the use of their available production factors to achieve their desired production outcomes. Farm production factors consist of four components: land, capital, labor, and skills (management). These factors serve as inputs into the farm production process. The farm production process combines these input factors to produce agricultural output (Arifin, 2015).

According to Nguyen et al., (2018), measuring and assessing farm production efficiency is a method for determining the level of input use (input combination) used by farmers to maximise output and determining potential efforts to improve this efficiency. This study aims to analyse the level of economic efficiency of smallholder oil palm plantations and the socio-economic factors influencing this efficiency in Lubuk Barumun District, Padang Lawas Regency, North Sumatra Province.

## Literature Review

In general, farmers carry out farming activities based only on habits and estimates. Therefore, rationality is needed to obtain maximum results and profits. Farmers have the opinion that the more inputs they use, the more results they will get. Imbalances in the use of production inputs often result in less than optimal income for farmers (Wulandari et.al, 2019).

The fundamental concept of efficiency is divided into technical efficiency and economic efficiency. Technical efficiency focuses on input relative to output; that is, minimising inputs

results in the same quantity of output. Economic efficiency is a broader concept than technical efficiency, whereby economic efficiency requires selecting the right mix of inputs and outputs to optimise economic performance by minimising costs and maximising profits (Aziza et.al., 2022)

Economic efficiency occurs when farmers increase their yields by reducing the price of production factors and selling their output at a high price. In other words, farmers are simultaneously achieving economic efficiency, as well as technical and price efficiency. The concept of economic efficiency is cost minimisation, meaning a production process will be economically efficient at a given output level if no other process can produce the same output at a lower cost (Chotimah, 2019).

The persistently low productivity of smallholder oil palm plantations in North Sumatra Province and even in Indonesia indicates that production efficiency (including economic efficiency) in oil palm plantations is also low. Thus, the study of the economic efficiency of smallholder oil palm plantations aims to optimise resource utilisation and minimise wasteful use, thereby facilitating better management of smallholder oil palm plantations in the future.

Various factors, including socioeconomic factors, influence the economic efficiency of oil palm plantations. Research on socioeconomic factors cannot be traced to the economic efficiency of oil palm plantations. What is found is the economic efficiency of non-smallholder oil palm farms, as well as the socioeconomic factors that influence it. Study of effect farmer gender on economic efficiency has been conducted by Asfaw (2019), Effendy et al., (2019) and Obi and Ayodeji (2020). Study of effect farmer age on economic efficiency has been conducted by Asfaw (2019), Rosdiantini (2020), Iskandar (2022), Imran et al., (2019), and Chebil et al., (2015). Study of farmer education on economic efficiency has been conducted by Rosdiantini (2020), Chebil et al., (2015), Haile (2015), Teferra et al., (2018) and Asfaw (2019). Study of effect farmer farming experience on economic efficiency has been conducted by Iskandar (2022), Obi and Ayodeji (2020), Haile (2015), (Rosdiantini, 2020) and (Chebil et al., 2015). Study of effect farmer family size on economic efficiency has been conducted by Iskandar (2022), Rosdiantini (2020) and Haile (2015). Study of effect type of seed used by farmer on economic efficiency has been conducted by Effendy et al., (2019). Study of effect number of productive crops cultivated by farmer on economic efficiency has been conducted by Chebil et al., (2015). Study of effect farmer credit access on economic efficiency has been conducted by Teferra et al., (2018), Haile (2015), Obi and Ayodeji (2020), Effendy et al., (2019) and Imran et al., (2019). Study of effect distance from farmer's residence to input market on economic efficiency has been conducted by Teferra et al., (2018). Study of effect farmer experience applying organic fertilizer on economic efficiency has been conducted by Effendy et al., (2019). Study of effect farmer experience in participating in farmer organisations on economic efficiency has been conducted by Effendy et al., (2019). Study of effect farmer experience in using information and technology tools related to farm management on economic efficiency never been done or can non be traced.

The study will utilize the twelve variables above as factors effecting on economic efficiency of smallholder oil palm plantations. In addition, studies that has been conducted generally uses the Stochastic Frontier Method while this study use Data Envelopment Analysis Method as something new approach in study of smallholder oil palm plantations,

## Research Method

The research area was determined purposively (intentionally) with consideration because according to data from the BPS Provinsi Sumatera Utara (2024), and the BPS Kabupaten Padang Lawas (2024), Barumon District is the area that has the largest area of oil palm plantations in Padang Lawas Regency, while Padang Lawas Regency is the regency that has the largest area of

oil palm plantations in the West Coast region of North Sumatra Province. The research sample was determined through quota sampling of 150 oil palm plantation farmers from two villages in Padang Lawas District: Aek Lancat Village, with 75 samples, and Pagaran Mompang Village, with 75 samples. The research data are in the form of primary data obtained directly from farmers through interviews using a prepared questionnaire, providing information on the management of smallholder oil palm plantations for the year 2023.

### Economic Efficiency Calculation

Economic efficiency calculations were performed using the Data Envelopment Analysis (DEA) method. This non-parametric approach utilises a deterministic (linear programming) approach to analyse production functions by mapping the production frontier (Camanho et. al., 2024) This study employed input-oriented DEA because it aimed to determine the optimal combination of inputs that yields the maximum output. The model used was the VRS (variable returns to scale) model, also known as pure efficiency. The VRS model is used to estimate efficiency when increases or decreases in inputs or outputs do not result in proportional changes in output. This model assumes that the company is not yet operating at its optimal scale. The VRS model can exhibit increasing, constant, and decreasing returns to scale (Rusydiana, 2013), as noted in Sulistyaningsih et al., (2019).

Economic efficiency is calculated using a cost-efficiency model, where the cost minimisation or economic efficiency (EE) of the i-th input vector for a DMU is given by  $X_i$ , the input price vector is  $W_i$ , and its output level is  $Y_i$ . Overall, the EE score of the i-th DMU is calculated as the ratio of the minimum cost, where the cost is observed and is proportional to the EE score. If  $EE = 1$  is considered economically efficient,  $EE < 1$  indicates that EE is not achieved (Camanho et. al., 2024).

Thus, Economic Efficiency (EE) can be calculated using the following equation:

$$EE = \frac{W_i'X_i'}{W_i'X_i}$$

Where:

- EE = Economic Efficiency based on the principle of cost minimization ( $0 \leq EE \leq 1$ )
- $X_i$  = Actual Input Quantity (Land, Labor, Fertilizer, Pesticide)
- $W_i$  = Input Price (Land, Labor, Fertilizer, Pesticide)
- $X_i'$  = Target Input Quantity

DEA analysis results also provide information on the amount of input costs that farmers should use to achieve an economically efficient production process. Therefore, smallholder oil palm farmers must adjust their input costs (either reduce or increase) for the future. The percentage change in input costs can be determined using the following formula:

$$\text{Percentage change in input costs (\%)} = \frac{\text{Actual Input Cost} - \text{Target Input Cost}}{\text{Actual Input Cost}} \times 100 \%$$

Note:

Actual input cost is the cost of using inputs obtained from respondent farmers.

Target input cost refers to the cost of utilising inputs recommended by the DEA model.

### The Effect of Farmer Socioeconomic Factors on Economic Efficiency

To analyse the effect of farmer socioeconomic factors on economic efficiency, a Censored Tobit Regression Test can be performed. The Censored Tobit method is based on the assumption that all independent variables have uncensored or unrestricted values, but the dependent variable is censored. All variables (independent and dependent) can be measured accurately, and the mathematical model used is accurate, with no autocorrelation, heteroscedasticity, or perfect multicollinearity (Jain et al., 2022).

The Tobit Regression function in this study can be written as described by Amore & Martinu (2021) :

$$EF = b_0 + b_1X_1 + b_2X_2 + \dots + \dots + b_{12}X_{12} + e$$

Description:

EF = Economic efficiency score obtained from DEA

$b_0$  = Intercept

$b_1$ - $b_{12}$  = Regression Coefficient

$X_1$  = Farmer Gender (0 = Female; 1 = Male)

$X_2$  = Farmer Age (years)

$X_3$  = Farmer Education (years)

$X_4$  = Farmer Farming Experience (years)

$X_5$  = Farmer Family Size (persons)

$X_6$  = Type of Seed Used by Farmer (0 = Uncertified; 1 = Certified)

$X_7$  = Number of Productive Crops Cultivated by Farmer (trees)

$X_8$  = Farmer Credit Access (0 = None; 1 = Yes)

$X_9$  = Distance from Farmer's Residence to Input Market (km)

$X_{10}$  = Farmer Experience Applying Organic Fertilizer (years)

$X_{11}$  = Farmer Experience in Participating in Farmer Organisations (years)

$X_{12}$  = Farmer Experience in Using Information and Technology Tools Related to Farm Management (years)

The partial effect of the independent variable ( $X_i$ ) on the dependent variable (Y) can be determined by conducting the Z-test. The test criteria used are:

1. If the probability value Z is  $\geq 0.05$ , then the independent variable  $X_i$  has no significant partial effect on Y.
2. If the probability value Z is  $< 0.05$ , then the independent variable  $X_i$  has a significant partial effect on Y.

The simultaneous effect of independent variables ( $X_i$ ) on the dependent variable (Y) can be determined by conducting a Likelihood Ratio Test or G-Test using the following test criteria according to Upaya (2021):

1. If the likelihood ratio probability value is  $\geq 0.05$ , then all independent variables simultaneously have no significant effect on Y.
2. If the likelihood ratio probability value is  $< 0.05$ , then all independent variables simultaneously have a significant effect on Y.

The magnitude of the effect of  $X_1$ ,  $X_2$ , and  $X_{12}$  on Y can be determined from the coefficient of determination ( $R^2$ ). The value of  $1 - R^2$  represents the magnitude of the influence of other independent variables not included in the model or not studied.

## Results and Discussion

### 1. Descriptive Statistics

The descriptive analysis of the research data encompasses both the descriptive analysis of input-output cost variables and the descriptive analysis of farmer socio-economic factors.

#### a. Descriptive Analysis of Input-Output Cost Variables

The input-output cost variables in this study include land area, labour, fertilizer, pesticides, and smallholder oil palm plantation production in the study area for 2023, as shown below.

**Table 1. Descriptive Statistics of Input-Output Cost Variables**

| No. | Variable<br>Input-Output Cost | Mean         | Min          | Max           | Std. Dev.    |
|-----|-------------------------------|--------------|--------------|---------------|--------------|
| 1   | Land Cost (Rp)                | 5.769.333,33 | 1.300.000,00 | 15.500.000,00 | 3.075.993,79 |
| 2   | Labor Cost (Rp)               | 7.868.000,00 | 1.600.000,00 | 19.200.000,00 | 3.760.467,63 |
| 3   | Fertilizer Cost (Rp)          | 3.220.700,00 | 550.000,00   | 11.850.000,00 | 1.944.725,62 |
| 4   | Pesticide Cost (Rp)           | 873.233,33   | 212.500,00   | 2.380.000,00  | 460.654,41   |
| 5   | Production (kg FFB)           | 55.096,67    | 12.300,00    | 148.800,00    | 28.765,76    |

**b. Descriptive Analysis of Socioeconomic Factor Variables**

The socioeconomic factor variables in this study consist of farmer gender, farmer age, farmer education, farmer farming experience, farmer family size, type of seed used, number of productive crops cultivated, farmer access to credit, distance from farmer residence to input markets, farmer experience applying organic fertilizer, farmer participation in farmer organizations, and farmer experience in using information and technology tools related to farm management, as shown below.

**Table 2. Descriptive Statistics of Socioeconomic Factor Variables**

| No. | Factor Variable<br>Socioeconomic       | Mean     | Min | Max | Std. Dev. |
|-----|----------------------------------------|----------|-----|-----|-----------|
| 1   | Gender (0 = female ; 1 = male)         | 0,5733   | 0   | 1   | 0,4962    |
| 2   | Age (Years)                            | 51,7200  | 42  | 62  | 4,3507    |
| 3   | Education (Years)                      | 12,5867  | 9   | 17  | 2,0140    |
| 4   | Farming Experience (Years)             | 19,1600  | 14  | 24  | 2,4054    |
| 5   | Family Size (People)                   | 5,5267   | 4   | 7   | 0,8085    |
| 6   | Seed Type (0 = random ; 1 = certified) | 0,6133   | 0   | 1   | 0,4886    |
| 7   | Number of Plants (Trees)               | 274,5400 | 65  | 706 | 143,4659  |
| 8   | Access to Credit (0 = None ; 1 = Yes)  | 0,3667   | 0   | 1   | 0,4835    |
| 9   | Distance to Input Market (Km)          | 2,1753   | 1,4 | 3,5 | 0,4625    |
| 10  | Organic Fertilizer Application (Years) | 3,0200   | 0   | 10  | 4,2843    |
| 11  | Organisational Experience (Years)      | 12,8467  | 8   | 16  | 1,7677    |

**2. Economic Efficiency Calculation**

The results of the economic efficiency calculation for smallholder oil palm plantations are presented in Table 3.

**Table 3. Economic Efficiency of Smallholder Oil Palm Plantations**

| No. | Description         | Mean   | Min    | Max | Std. Dev. |
|-----|---------------------|--------|--------|-----|-----------|
| 1   | Economic Efficiency | 0,8789 | 0,7410 | 1   | 0,0657    |

Source: Primary Data Processing

Based on Table 3, the average economic efficiency value for smallholder oil palm plantations is 0.8789, a minimum value of 0.7410, a maximum of 1, and a standard deviation of 0.0657.

Based on this average economic efficiency value, it can be concluded that the respondent farmers' ability to minimise input usage and input costs to obtain economically efficient outputs is 87.89%. Farmers still have the opportunity to achieve higher potential yields, reaching the maximum yields achieved by the most economically efficient farmers. The results of this study indicate that farmers, overall, can still increase their economic efficiency by 12.11% at the existing level of technology and inputs.

Based on the economic efficiency values obtained, the research samples can be categorised as efficient and inefficient, as shown in Table 4.

**Table 4. Share of Economic Efficiency Values**

| No.          | Economic Efficiency Value  | Number (Sample) | Percentage (%) |
|--------------|----------------------------|-----------------|----------------|
| 1            | Efficient (EE Value = 1)   | 5               | 3,33           |
| 2            | Inefficient (EE Value < 1) | 145             | 96,67          |
| <b>Total</b> |                            | <b>150</b>      | <b>100,00</b>  |

Source: Primary Data Processing

Table 4 shows that the majority (96.67%) of sample farmers have economically inefficient production processes (EE Value < 1), and 3.33% of sample farmers have economically efficient production processes (EE Value = 1).

Further DEA analysis of production scale (rate of technical substitution or RTS) based on economic efficiency reveals that smallholder oil palm plantation production processes exist at various production scales, as shown in Table 5.

**Table 5. Share of Production Scale Based on Economic Efficiency Analysis**

| No.          | Production Scale                  | Number (Sample) | Percentage (%) |
|--------------|-----------------------------------|-----------------|----------------|
| 1            | Increasing Returns to Scale (IRS) | 22              | 14,67          |
| 2            | Constant Returns to Scale (CRS)   | 0               | 0,00           |
| 3            | Decreasing Returns to Scale (DRS) | 128             | 85,33          |
| <b>Total</b> |                                   | <b>150</b>      | <b>100,00</b>  |

Source: Primary Data Processing

Table 5 shows that of the 150 research samples, the majority, or 85.33%, exhibit decreasing returns to scale, and 14.67% exhibit increasing returns to scale.

Based on the economic efficiency values of smallholder oil palm plantations, which are largely inefficient, the DEA analysis provides further insights into the use of actual input costs and target input costs, as well as changes in input use required to achieve economic efficiency. This description is presented in Table 6.

**Table 6. Summary of Actual Input Costs, Target Input Costs, and Changes in Input Cost Use Based on Economic Efficiency Values**

| No.                      | Description     | Mean         | Min          | Max           | Std. Dev.    |
|--------------------------|-----------------|--------------|--------------|---------------|--------------|
| <b>Actual Input Cost</b> |                 |              |              |               |              |
| 1                        | Land (Rp)       | 5.769.333,33 | 1.300.000,00 | 15.500.000,00 | 3.075.993,79 |
| 2                        | Labor (Rp)      | 7.868.000,00 | 1.600.000,00 | 19.200.000,00 | 3.760.467,63 |
| 3                        | Fertilizer (Rp) | 3.220.700,00 | 550.000,00   | 11.850.000,00 | 1.944.725,62 |
| 4                        | Pesticides (Rp) | 873.233,33   | 212.500,00   | 2.380.000,00  | 460.654,41   |

### 3. The Effect of Farmer Socioeconomic Factors on Economic Efficiency

Farmer socioeconomic factors suspected of effecting economic efficiency and serving as independent variables in this study include farmer gender ( $X_1$ ), farmer age ( $X_2$ ), farmer education ( $X_3$ ), farming experience ( $X_4$ ), farmer family size ( $X_5$ ), type of seed used ( $X_6$ ), number of productive crops cultivated ( $X_7$ ), farmer access to credit ( $X_8$ ), distance from farmer's residence to input markets ( $X_9$ ), farmer experience applying organic fertilizer ( $X_{10}$ ), farmer participation in farmer organizations ( $X_{11}$ ), and farmer experience in using information and technology tools related to farm management ( $X_{12}$ ). The effect of the independent variables on the dependent variable can be determined through a Censored Tobit Regression Test, the results of which are shown in Table 7.

**Table 7. Censored Tobit Regression Test Results**

| No. | Variable                                 | Coefficient | Probabilty Z | Std. Error |
|-----|------------------------------------------|-------------|--------------|------------|
| 1   | Gender                                   | 0,0273      | 0,001*       | 0,0085     |
| 2   | Age                                      | -0,0000     | 0,977        | 0,0008     |
| 3   | Education                                | 0,0011      | 0,503        | 0,0016     |
| 4   | Farming Experience                       | 0,0052      | 0,008*       | 0,0020     |

#### a. The Partial Influence of Socioeconomic Factors on Economic Efficiency

Based on the results of the Censored Tobit Regression Test in Table 7, the partial effect of farmer socioeconomic factors on the economic efficiency of smallholder oil palm plantations can be explained as follows:

- 1) Farmer gender partially has a significant positive effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations shows significant differences based on farmer gender, with male farmers having more economically efficient farming production processes than female farmers. These research results align with the findings of Asfaw (2019) and Effendy et al., (2019), but are inconsistent with those of Obi and Ayodeji (2020).
- 2) Farmer age has no significant effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations does not show significant differences based on the age of the farmers. The research results obtained are in line with those of Iskandar (2022), Imran et al., (2019), and Chebil et al., (2015); however, they do not align with the findings of Asfaw (2019) and Rosdiantini (2020).
- 3) Farmer education had no significant effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations showed no significant differences based on the level of farmer education. The results of this study align with those of Rosdiantini (2020), Chebil et al., (2015), and Haile (2015) but differ from those of Teferra et al., (2018) and Asfaw (2019).
- 4) Farmer farming experience partially had a significant positive effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations showed significant differences based on their farming experience, with farmers who had more experience in farming exhibiting more economically efficient farming production processes than those with less experience. These results align with those of Iskandar (2022), Obi and Ayodeji (2020), and Haile (2015), but not with those of (Rosdiantini, 2020) and (Chebil et al., 2015).
- 5) The farmer family size partially has a significant adverse effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations shows significant differences based on family size, with farmers with smaller families experiencing more economically efficient farming production processes than those with larger families. The results of this study align with those of Iskandar (2022) but differ from those of Rosdiantini (2020) and Haile (2015).
- 6) The type of seed used by farmers partially has a significant positive effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations shows significant differences based on the type of seed used, with farmers using certified seeds experiencing more economically efficient farming production processes than those using uncertified seeds. These results align with those of Effendy et al., (2019).
- 7) The number of productive crops cultivated by farmers had no significant effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations showed no significant difference based on the number of productive crops cultivated by farmers. The results of this study are inconsistent with those of Chebil et al., (2015).
- 8) Farmers' access to credit had no significant effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations showed no significant difference based on their access to credit. The results of this study align with those of Teferra et al., (2018), Haile (2015), and Obi and Ayodeji (2020), but do not align with those of Effendy et al., (2019) and Imran et al., (2019).

- 9) The distance from farmers' residences to input markets partially had a significant positive effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations exhibits significant differences based on the distance from the farmer's residence to the input market. Specifically, farmers whose residences are further from the input market tend to have more economically efficient farming production processes than those whose residences are closer to the input market. The research results obtained do not align with those of Teferra et al., (2018)..
- 10) Farmers' experience in applying organic fertiliser partially had a significant adverse effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations showed a significant difference based on their experience in applying organic fertiliser, where farmers with less experience in applying organic fertiliser were more economically efficient in their farming production processes than those with more experience. The results of this study are inconsistent with those of Effendy et al., (2019).
- 11) Farmers' experience in farmer organisations had no significant effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations did not show any significant difference based on their experience in participating in farmer organisations. The results of this study are inconsistent with those of Iskandar (2022).
- 12) Farmers' experience in using information and technology tools related to farm management had no significant effect on the economic efficiency of smallholder oil palm plantations. The economic efficiency of smallholder oil palm plantations did not show any significant difference based on their experience in using information and technology tools related to farm management.

#### **b. The Simultaneous Effect of Farmers' Socioeconomic Factors on Economic Efficiency**

Farmers' socioeconomic factors simultaneously have a significant effect on the economic efficiency of smallholder oil palm plantations. That is demonstrated by the coefficient of determination ( $R^2$ ) of 0.6608, indicating that the independent variables contribute 66.08% to the economic efficiency of smallholder oil palm plantations, while other factors not included in the regression model or not studied contribute 33.92%.

### **Conclusion**

Most (85.33%) of smallholder oil palm plantations in Lubuk Barumun District, Padang Lawas Regency, are not economically efficient, with an average economic efficiency value of 0.8789. Efforts to achieve a technically efficient production process require smallholder farmers to make changes in the use of input costs, namely increasing land costs by 3.0507%, reducing labour costs by 18.2582%, reducing fertiliser costs by 22.6218%, and increasing pesticide costs by 2.9480%. Gender, farming experience, family size, type of seed used, distance from the farmer's residence to the input market, and experience in applying organic fertiliser have a significant effect on the economic efficiency of smallholder oil palm plantations. Meanwhile, age, education, the number of productive oil palm plants cultivated, access to credit, experience of participation in farmer organisations, and experience of farmers using information and technology facilities related to farming management have no significant effect on the economic efficiency of smallholder oil palm plantations.

#### **Abstract**

This study aims to determine the technical efficiency value of smallholder oil palm plantations in Bandar Pasir Mandoge District and to identify the socio-economic factors that influence the technical efficiency of these plantations. The method of determining the area was purposive, specifically in Huta Padang Village and Huta Bagasan Village, Bandar Pasir Mandoge District, Asahan Regency. This sampling method employs simple random sampling. This research method employs the Data Envelopment Analysis (DEA) approach to estimate technical efficiency, and also utilises Tobit regression to evaluate the factors that influence efficiency. The results of this study are: (1) The technical efficiency value of smallholder oil palm plantations in Bandar Pasir Mandoge District based on the CRS assumption is 0.929, the technical efficiency value based on the VRS assumption is 0.941, the technical efficiency value SE is 0.987 which means that from the three variables, farmers are still not said to be efficient. The dominant production scale is in the IRS. The average input reduction is based on the CRS assumption (2) Socio-economic factors that significantly influence the technical efficiency of smallholder oil palm plantations in Bandar Pasir Mandoge District are education, farming experience and application of organic fertiliser. Socio-economic factors that have an insignificant influence on the technical efficiency of smallholder oil palm plantations in Bandar Pasir Mandoge District include gender, number of family members, distance to the PKS, and access to credit.

**Keywords:** Data Envelopment Analysis; Efficiency; Palm Oil; Production; Tobit Regression.

#### **Abstrak**

Penelitian ini bertujuan untuk mengetahui nilai efisiensi teknis perkebunan kelapa sawit rakyat; untuk mengetahui faktor-faktor sosial ekonomi yang mempengaruhi efisiensi teknis perkebunan kelapa sawit rakyat di daerah penelitian. Metode penentuan daerah penelitian secara purposive yaitu, di Desa Huta Padang dan Desa Huta Bagasan, Kecamatan Bandar Pasir Mandoge, Kabupaten Asahan. Metode pengambilan sampel menggunakan *Simple Random Sampling*. Metode penelitian ini menggunakan pendekatan *Data Envelopment Analysis* (DEA). Hasil penelitian ini adalah nilai efisiensi teknis perkebunan kelapa sawit rakyat berdasarkan asumsi CRS sebesar 0,929, berdasarkan asumsi VRS sebesar 0,941, nilai efisiensi teknis SE sebesar 0,987 yang berarti dari ketiga variabel tersebut petani belum efisien dan skala produksi dominan berada di IRS. Faktor-faktor sosial ekonomi yang berpengaruh signifikan efisiensi teknis perkebunan kelapa sawit rakyat di daerah penelitian adalah pendidikan, pengalaman bertani dan aplikasi pupuk organik. Faktor-faktor sosial ekonomi yang berpengaruh tidak signifikan efisiensi teknis perkebunan kelapa sawit rakyat di daerah penelitian adalah jenis kelamin, jumlah anggota keluarga, jarak ke PKS, dan akses kredit.

**Kata Kunci:** Data Envelopment Analysis, Efisiensi, Kelapa Sawit, Produksi, Regresi Tobit.

## 1. Pendahuluan

Sektor pertanian merupakan salah satu sektor yang berperan penting dalam ekonomi nasional. Hal tersebut dapat dibuktikan dengan nilai Produk Domestik Bruto (PDB) sektor pertanian pada tahun 2022 adalah sekitar 12,40 % (BPS Indonesia, 2023). Sektor pertanian terdiri dari beberapa sub sektor, yaitu sub sektor tanaman pangan, sub sektor tanaman hortikultura, sub sektor tanaman perkebunan, sub sektor tanaman kehutanan, sub sektor peternakan dan sub sektor perikanan (BPS Indonesia, 2023).

Produksi kelapa sawit didominasi oleh tiga pihak utama, yakni perkebunan rakyat, perkebunan besar milik negara dan perkebunan besar swasta. Meskipun perkebunan rakyat atau petani kecil berperan signifikan dalam produksi kelapa sawit, namun produktivitasnya masih lebih rendah dibandingkan dengan perkebunan besar swasta dan perkebunan milik negara.

Perkebunan rakyat menyumbang sebesar 34,74% dari total produksi kelapa sawit, dengan tingkat produktivitas mencapai 2,58 ton/ha pada tahun 2023 (Ditjenbun, 2023). Produktivitas perkebunan rakyat menempati tingkat yang paling rendah di antara tiga kelompok pelaku yang mengindikasikan bahwa petani kecil kesulitan menghasilkan hasil (output) yang maksimal. Rendahnya produktivitas perkebunan rakyat menunjukkan bahwa mereka tidak dapat mengatur penggunaan input dengan efisien (Abdul *et al.*, 2022). Tanaman kelapa sawit telah menjadi usaha perkebunan utama dengan total luas areal perkebunan kelapa sawit rakyat sebesar 6.300.426 ha dan jumlah produksi sebesar 16.273.170 ton. Hal ini juga menjadikan kelapa sawit sebagai pendorong ekonomi dan sosial masyarakat di Indonesia (Syuhada *et al.*, 2022).

Provinsi Sumatera Utara termasuk salah satu provinsi sentra budidaya tanaman kelapa sawit rakyat di Indonesia. Menurut Direktorat Jenderal Perkebunan (2023), Provinsi Sumatera Utara masuk dalam lima besar provinsi dengan luas areal terbesar di Indonesia. Sulawesi Selatan menempati posisi ke lima dalam hal budidaya kelapa sawit rakyat dibawah Kalimantan Barat dan Sumatera Selatan dalam hal luas areal dengan luas 501.392 Ha, produksi sebesar 1.698.331 ton dan produktivitas sebesar 3,39 ton/Ha pada tahun 2023.

Kabupaten Asahan merupakan daerah penghasil kelapa sawit terbesar di Provinsi Sumatera Utara dengan jumlah produksi sebesar 1.654,04 ribu ton pada tahun 2021 dan sebesar 1.663,03 ribu ton pada tahun 2022. Dengan luas areal sekitar 77,29 ribu Ha pada tahun 2021 dan 77,99 ribu Ha pada tahun 2022 (BPS Sumatera Utara, 2023).

Kecamatan Bandar Pasir Mandoge sebagai salah satu sentral penghasil kelapa sawit kedua terbesar setelah Kecamatan Bandar Pulau di Kabupaten Asahan. Kecamatan Bandar Pasir Mandoge memiliki luas areal pada tahun 2021-2022 sebesar 9.520,21 ha, produksi yang dihasilkan pada tahun 2021 sebesar 211.099,54 ton dan pada tahun 2022 produksi kelapa sawit di daerah tersebut sebesar 202.444,62 ton, dengan produktivitas pada tahun 2021 sebesar 22,17 ton/ha dan 21,26 ton/ha pada tahun 2022 (BPS Asahan, 2023). Data luas areal, produksi, produktivitas, dan pertumbuhan kelapa sawit perkebunan rakyat Kecamatan Bandar Pasir Mandoge tahun 2018-2022 disajikan pada Tabel 1.

Tabel 1  
Luas Areal, Produksi, Produktivitas dan Pertumbuhan Kelapa Sawit Perkebunan Rakyat Kecamatan Bandar Pasir Mandoge Kabupaten Asahan Dari Tahun 2018-2022.

| Tahun            | Luas Areal<br>(Ha) | Produksi<br>(Ton) | Produktivitas<br>(Ton/Ha) | Pertumbuhan<br>% |
|------------------|--------------------|-------------------|---------------------------|------------------|
| 2018             | 9.465,00           | 207.176,30        | 21,89                     | -                |
| 2019             | 9.465,00           | 209.879,00        | 22,17                     | 1,28             |
| 2020             | 9.465,00           | 199.891,00        | 21,12                     | -4,74            |
| 2021             | 9.520,21           | 211.099,54        | 22,17                     | 4,97             |
| 2022             | 9.520,21           | 202.444,62        | 21,26                     | -4,10            |
| <b>Rata-rata</b> | <b>9.487,08</b>    | <b>206.098,09</b> | <b>21,72</b>              | <b>-0,65</b>     |

(Sumber: BPS Mandoge, 2019-2023)

Berdasarkan data pada Tabel 1 menunjukkan luas areal, produksi, produktivitas, serta pertumbuhan kelapa sawit rakyat di Kecamatan Bandar Pasir Mandoge dalam kurun waktu lima tahun terakhir mengalami fluktuasi.. Walaupun sempat mengalami kenaikan produksi, produktivitas, dan pertumbuhan yang sangat signifikan pada tahun 2021, tetapi kembali mengalami penurunan produksi pada tahun 2022 sebesar 8.654,92 ton yang juga berdampak pada penurunan angka produktivitas dan pertumbuhan. Fenomena tersebut menimbulkan pertanyaan terkait faktor-faktor yang mempengaruhi efisiensi teknis perkebunan kelapa sawit rakyat di wilayah tersebut.

Permasalahan yang timbul secara internal dan eksternal dalam pengelolaan perkebunan kelapa sawit rakyat yang di alami oleh petani sawit di Kecamatan Bandar Pasir Mandoge adalah keterbatasan modal yang menyebabkan produktivitas kelapa sawit yang rendah (Apriyanti & Ramadhani, 2018). Kesulitan petani dalam peremajaan (replanting) tanaman yang sudah tidak produktif karena tidak memiliki dana yang cukup sehingga mengakibatkan penurunan produksi kelapa sawit (Syuhada *et al.*, 2022; Putri *et al.*, 2023). Penurunan harga jual TBS yang diterima oleh petani kelapa sawit rakyat (Jamilah, 2022). Dan kenaikan harga input (pupuk) yang terus meningkat (Harahap, 2023).

Keadaan yang dihadapi petani menyebabkan produksi tidak meningkat dan tidak mampu mengoptimalkan input produksi. Penelitian terdahulu sudah banyak yang meneliti mengenai efisiensi teknis kelapa sawit di Indonesia, seperti: kajian Yahyawi *et al.*, (2022) di Kabupaten Sanggau, kajian Welda *et al.*, (2020) di Kabupaten Dharmastraya Provinsi Sumatera Barat, dan kajian Syuhada *et al.*, (2022) di Kabupaten Pasaman Barat. Ketiga kajian tersebut menggunakan pendekatan *Stochastic Frontier Analysis* (SFA) untuk mengukur efisiensi teknis kelapa sawit. *Stochastic Frontier Analysis* memiliki beberapa kelemahan, yaitu mengabaikan asumsi independen, memerlukan bentuk fungsional tertentu, dan hanya dapat mengukur satu output. Pendekatan *Data Envelopment Analysis* (DEA) dapat digunakan untuk mengatasi kelemahan pendekatan parametrik SFA (Simatupang & Nababan, 2023; Syarif, 2020). Oleh karena itu, penulis tertarik untuk menguji terkait efisiensi teknis perkebunan

kelapa sawit rakyat di Kecamatan Bandar Pasir Mandoge Kabupaten Asahan pendekatan yang lebih spesifik.

## 2. Metode Penelitian

Penentuan daerah penelitian ini dilakukan dengan metode secara sengaja (*purposive*) dengan lokasi penelitian adalah Desa Huta Padang dan Desa Huta Bagasan, Kecamatan Bandar Pasir Mandoge, Kabupaten Asahan. Daerah tersebut dipilih menjadi lokasi penelitian karena Kabupaten Asahan merupakan kabupaten penghasil kelapa sawit terbesar di Sumatera Utara dan Kecamatan Bandar Pasir Mandoge merupakan kecamatan penghasil kelapa sawit terbesar kedua tertinggi di Kabupaten Asahan setelah Kecamatan Bandar Pulau.

Penentuan sampel populasi dalam penelitian ini adalah petani kelapa sawit. Populasi penelitian ini sebanyak 110 orang petani yaitu masyarakat yang berkerja sebagai petani. Metode penentuan sampel yang digunakan adalah metode *Simple Random Sampling*.

Metode analisis data yang dilakukan yaitu secara pengamatan langsung kepada reponden yang ada di daerah penelitian untuk dapat melihat jelas bagaimana penggunaan faktor-faktor produksi pada usahatani tersebut. Metode analisis yang kedua yaitu dengan menggunakan perhitungan efisiensi teknis dan metode *Data Envelopment Analysis* (DEA) yaitu pendekatan pemrograman matematis non-parametrik untuk estimasi perbatasan (Asyarif & Hanani, 2018).

Model analisis regresi *Tobit* dapat dilihat pada persamaan sebagai berikut:

$$TE = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \beta_4X_4 + \beta_5X_5 + \dots + \beta_7X_7 + e$$

Keterangan:

TE = Skor efisiensi teknis

X1 = *Dummy* jenis kelamin (0= perempuan, 1= laki-laki)

X2 = Pendidikan (tahun)

X3 = Jumlah anggota keluarga (jiwa)

X4 = Pengalaman berusahatani kelapa sawit (tahun)

X5 = Jarak ke PKS (km)

X6 = *Dummy* akses kredit (0= tidak ada, 1 =ada)

X7 = *Dummy* aplikasi pupuk organik (0= tidak menggunakan, 1= menggunakan)

e = Standar Error

$\beta$  = Parameter yang diestimasi

## 3. Hasil dan Pembahasan

### Statistik Deskriptif Variabel Sosial Ekonomi

Rata-rata deskriptif variabel sosial ekonomi dapat dilihat pada tabel 2 di bawah ini.

Tabel 2  
Rata-Rata Statistik Deskriptif Variabel Sosial Ekonomi

| No | Variabel Sosial Ekonomi                                            | Mean  | Stand.Dev | Min | Max |
|----|--------------------------------------------------------------------|-------|-----------|-----|-----|
| 1  | Jenis Kelamin<br>(0= perempuan, 1 = laki-laki)                     | 0,84  | 0,37      | 0   | 1   |
| 2  | Pendidikan (Tahun)                                                 | 10,65 | 2,68      | 6   | 16  |
| 3  | Jumlah Anggota Keluarga (Jiwa)                                     | 3,86  | 1,62      | 1   | 8   |
| 4  | Pengalaman Bertani (Tahun)                                         | 18,95 | 8,23      | 2   | 37  |
| 5  | Jarak Ke PKS (Km)                                                  | 4,71  | 3,19      | 0,5 | 20  |
| 6  | Akses Kredit (0= tidak ada, 1= ada)                                | 0,4   | 0,49      | 0   | 1   |
| 7  | Aplikasi Pupuk Organik<br>(0=tidak menggunakan,<br>1= menggunakan) | 0,091 | 0,29      | 0   | 1   |

(Sumber: Data primer diolah)

Tabel 2 menunjukkan variabel jenis kelamin kepala rumah tangga petani kelapa sawit dilokasi penelitian mempunyai nilai rata-rata (mean) sebesar 0,84 hal ini menunjukkan bahwa petani kelapa sawit di Desa Huta Padang dan Desa Huta Bagasan sebesar 84% berjenis kelamin laki-laki dan standar deviasi sebesar 0,37.

Variabel pendidikan petani kelapa sawit dilokasi penelitian mempunyai nilai rata-rata (mean) sebesar 10,65 tahun, nilai standar deviasi sebesar 2,68 tahun, nilai terkecil (minimum) dan terbesar (maksimum) sebesar 6 tahun; 16. Hal ini menunjukkan rata-rata pendidikan terakhir petani kelapa sawit sekolah menengah Atas (SMA). Pendidikan tertinggi petani kelapa sawit adalah 16 tahun atau sarjana (S1) sedangkan pendidikan terendah 6 tahun atau sekolah dasar (SD).

Variabel jumlah anggota keluarga petani kelapa sawit dilokasi penelitian mempunyai nilai rata-rata (mean) 3,86 jiwa, nilai terkecil (minimum) dan nilai terbesar (maksimum) sebesar 1 jiwa; 8 jiwa dan standar deviasi 1,62. Rata-rata jumlah anggota keluarga di Desa Huta Padang dan Huta Bagasan adalah 4 jiwa dengan jumlah anggota terbesar sebanyak 8 jiwa dan terkecil sebesar 1 jiwa.

Variabel pengalaman bertani di lokasi penelitian mempunyai nilai rata-rata sebesar 18,95 tahun nilai tertinggi (maksimum) sebesar 37 tahun dan nilai terendah (minimum) sebesar 2 tahun dan nilai standar deviasi sebesar 8,23 tahun. Hal ini menunjukkan bahwa petani kelapa sawit di daerah penelitian memiliki pengalaman bertani paling lama 37 tahun dan paling sedikit 2 tahun.

Variabel jarak ke PKS dilokasi penelitian mempunyai nilai rata-rata sebesar 4,71 km, nilai tertinggi (maksimum) sebesar 20 km dan nilai terendah (minimum) sebesar 0,5 km dan nilai standar deviasi sebesar 3,19. Hal ini menunjukkan jarak ke PKS petani kelapa sawit yang paling jauh sebesar 20 km dan yang paling dekat yaitu 0,5 km.

Variabel akses kredit dilokasi penelitian mempunyai nilai rata-rata sebesar 0,4, nilai tertinggi (maksimum) 1, nilai terendah (minimum) 0, dan nilai standar deviasi sebesar 0,49. Hal ini menunjukkan bahwa petani kelapa sawit di Desa Huta Padang dan

Desa Huta Bagasan sebanyak 40% memiliki pinjaman kredit untuk melakukan usaha mereka.

Variabel aplikasi pupuk organik di lokasi penelitian mempunyai nilai rata-rata sebesar 0,091, nilai tertinggi (maksimum) 1, nilai terendah (minimum) 0, dan nilai standar deviasi sebesar 0,29. Hal ini menunjukkan bahwa petani kelapa sawit di daerah penelitian sebanyak 9,1% menggunakan pupuk organik pada usahatani kelapa sawit.

### Hasil Efisiensi Teknis di Kecamatan Bandar Pasir Mandoge

Tabel 3  
 Nilai Efisiensi Teknis Berdasarkan Asumsi CRS, VRS, dan SE

| <b>Efisiensi</b> | <i>Mean</i> | <i>Standard Deviation</i> | <i>Min</i> | <i>Max</i> |
|------------------|-------------|---------------------------|------------|------------|
| TE CRS           | 0,929       | 0,056                     | 0,713      | 1          |
| TE VRS           | 0,941       | 0,052                     | 0,753      | 1          |
| SE               | 0,987       | 0,016                     | 0,909      | 1          |

(Sumber: Data primer diolah)

Tabel 3 menunjukkan nilai terkecil (minimum) efisiensi teknis berdasarkan asumsi CRS sebesar 0,713, sementara nilai terbesar (maksimum) efisiensi teknis berdasarkan asumsi CRS sebesar 1. Nilai rata-rata (Mean) efisiensi teknis berdasarkan asumsi CRS sebesar 0,929. Artinya perkebunan kelapa sawit rakyat di lokasi penelitian belum dapat dikatakan efisien, maka petani harus mengurangi penggunaan input sebesar 7,1% supaya usahatani yang tidak efisien menjadi efisien. Adapun nilai standar deviasi dari efisiensi teknis berdasarkan asumsi CRS sebesar 0,056. Nilai minimum efisiensi teknis berdasarkan asumsi VRS sebesar 0,753, sementara nilai maksimum efisiensi teknis berdasarkan asumsi VRS sebesar 1. Nilai rata-rata efisiensi teknis berdasarkan asumsi VRS sebesar 0,941 dimana usahatani tersebut belum dapat dikatakan efisien sehingga petani harus mengurangi input sebesar 5,9% supaya usahatani yang tidak efisien menjadi efisien. Adapun nilai standar deviasi dari efisiensi teknis berdasarkan asumsi VRS sebesar 0,052. Nilai terkecil (minimum) efisiensi SE sebesar 0,909, sedangkan nilai terbesar (maksimum) efisiensi SE sebesar 1. Nilai rata-rata skala efisiensi sebesar 0,987. Artinya, perkebunan kelapa sawit rakyat di lokasi penelitian belum dapat dikatakan efisien. Maka petani harus mengurangi penggunaan input sebesar 1,3% supaya usahatani yang tidak efisien menjadi efisien. Nilai standar deviasi dari skala efisiensi sebesar 0,016.

Dengan demikian didapatkan bahwa nilai efisiensi teknis perkebunan kelapa sawit rakyat di daerah penelitian berdasarkan asumsi CRS sebesar 0,929, VRS sebesar 0,941, dan SE sebesar 0,987, yang dimana nilai tersebut kurang dari satu.

## Faktor yang Mempengaruhi Efisiensi

### Spesifikasi Model

#### Uji Multikolinearitas

Multikolineritas dapat dilihat dari *Tolerance* dan *Variance Inflation Factor* (VIF). Hasil uji multikolineritas untuk CRS, VRS dan SE dapat dilihat pada Tabel 4.

Tabel 4  
Nilai VIF dari Setiap Variabel Independen

| No       | Variabel                | VIF  | 1/VIF    |
|----------|-------------------------|------|----------|
| 1        | Pendidikan              | 1,26 | 0,790524 |
| 2        | Jenis Kelamin           | 1,19 | 0,840875 |
| 3        | Pengalaman              | 1,19 | 0,843448 |
| 4        | Jarak ke PKS            | 1,06 | 0,940474 |
| 5        | Akses Kredit            | 1,03 | 0,967428 |
| 6        | Jumlah Anggota Keluarga | 1,03 | 0,970770 |
| 7        | Aplikasi Pupuk Organik  | 1,02 | 0,984631 |
| Mean VIF |                         | 1,11 |          |

(Sumber: Data primer diolah)

Tabel 4 menunjukkan nilai VIF dari setiap variabel independen. Nilai VIF berada pada rentang dari nilai 1,02 sampai 1,26. Rata-rata nilai VIF sebesar 1,11. Literatur Mardiatmoko, (2020) menyatakan bahwa nilai VIF dibawah 10 menunjukkan tidak terjadi multikolineritas. Berdasarkan literatur tersebut, hasil penelitian ini menunjukkan bahwa tidak terjadi multikolineritas.

#### Uji Heteroskedastisitas

Tabel 5  
Uji Heteroskedastisitas dari Tiga Variabel

| No | Variabel | Nilai             |        |
|----|----------|-------------------|--------|
|    |          | Chi-Sq. Statistic | Prob   |
| 1  | CRS      | 0,01              | 0,9127 |
| 2  | VRS      | 0,07              | 0,7889 |
| 3  | SE       | 17,09             | 0,0000 |

(Sumber: Data primer diolah)

Tabel 5 menunjukkan hasil output uji heteroskedastisitas untuk asumsi CRS nilai signifikannya sebesar (0,9127) > 0,05. Untuk asumsi VRS nilai signifikannya (0,7889) >

0,05 dan untuk SE nilai signifikannya (0,0000) < 0,05. Hal ini menunjukkan pada variabel CRS dan VRS bebas dari masalah heteroskedastisitas, sedangkan pada asumsi SE memiliki masalah heteroskedastisitas (Mardiatmoko, 2020).

#### Uji *Pseudo* ( $R^2$ )

Pada penelitian ini hasil uji *Pseudo R*<sup>2</sup> diperoleh sebesar -0,0507 untuk CRS. Hasil nilai untuk VRS sebesar -0,0850 dan nilai untuk SE sebesar -0,0170. Hasil *Pseudo R*<sup>2</sup> pada penelitian ini tidak sesuai dari nilai ketentuan *Pseudo R*<sup>2</sup> *Nagelkerke R Square* dimana nilai *Pseudo R*<sup>2</sup> antara nol sampai satu. Winarso et al., (2021) mengatakan *Pseudo R*<sup>2</sup> tidak dapat digunakan sebagai *goodness of fit* (kesesuaian) sehingga harus dibandingkan dengan nilai  $R^2$ . Nilai  $R^2$  pada penelitian ini sebesar 0,1054 pada CRS, 0,1102 pada VRS dan 0,0616 pada SE yang dimana dapat dijelaskan bahwa sebesar 10,54%; 11,02% dan 6,16% variabel independen dapat menjelaskan variabel dependen.

#### Uji Rasio *Likelihood*

#### Regresi *Tobit*

Tabel 6  
 Hasil Regresi *Tobit*

| No. | Variabel Independen     | CRS                     |           | VRS                     |           | SE                      |           |
|-----|-------------------------|-------------------------|-----------|-------------------------|-----------|-------------------------|-----------|
|     |                         | <i>Marginal Effects</i> | Prob.>  z | <i>Marginal Effects</i> | Prob.>  z | <i>Marginal Effects</i> | Prob.>  z |
| 1   | Jenis Kelamin           | 0,0006941               | 0,967     | -0,007341               | 0,665     | 0,0050296               | 0,292     |
| 2   | Pendidikan              | 0,0039075               | 0,098*    | 0,0055012               | 0,024**   | -0,000178               | 0,793     |
| 3   | Jumlah Anggota Keluarga | -0,002656               | 0,452     | -0,001305               | 0,716     | -0,001212               | 0,231     |
| 4   | Pengalaman Bertani      | 0,0006493               | 0,386     | 0,0002512               | 0,741     | 0,000363                | 0,092*    |
| 5   | Jarak ke PKS            | 0,0003928               | 0,829     | 0,0001137               | 0,951     | 0,0003891               | 0,455     |
| 6   | Akses Kredit            | 0,0162912               | 0,162     | 0,0160525               | 0,179     | 0,0040061               | 0,231     |
| 7   | Aplikasi Pupuk Organik  | 0,0544762               | 0,007***  | 0,0642578               | 0,004***  | 0,0071725               | 0,22      |

(Sumber: Data primer diolah)

Keterangan: \*, \*\*, \*\*\*: signifikansi pada  $\alpha$ = 10%, 5% dan 1%

Hasil penelitian ini menunjukkan nilai LR (*Likelihood Ratio*) berdasarkan asumsi CRS dan SE sebesar 0,0930;  $0,2992 > 0,05$  maka dapat disimpulkan tidak ada satu variabel bebas yang mempengaruhi variabel dependen. Nilai *Likelihood Ratio* (LR) untuk *Variable Return To Scale* (VRS) sebesar  $0,0243 < 0,05$  maka dapat disimpulkan ada satu atau semua variabel bebas yang mempengaruhi variabel dependen (Winarso et al., 2021).

### Pengaruh Jenis Kelamin terhadap Efisiensi Teknis Kelapa Sawit Rakyat

Variabel jenis kelamin berpengaruh positif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi CRS dan SE yang dapat dilihat dari nilai koefisien sebesar 0,0006941; 0,0050296 yang menunjukkan bahwa 1% peningkatan sampel kepala rumah tangga yang berjenis kelamin laki-laki akan meningkatkan efisiensi sebesar 0,0006941% dan 0,0050296%. Koefisien positif jenis kelamin terhadap efisiensi teknis sesuai kajian Abbeam et al., (2020) yang mengatakan bahwa efisiensi teknis berorientasi pada manajer laki-laki daripada manajer perempuan, karena lahan pertanian yang dikelola perempuan kurang produktif dibandingkan lahan yang dikelola laki-laki. Variabel jenis kelamin berpengaruh negatif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi VRS yang dapat dilihat dari nilai koefisien sebesar -0,007341 yang menunjukkan bahwa 1% peningkatan sampel kepala rumah tangga yang berjenis kelamin laki-laki akan menurunkan efisiensi sebesar -0,007341%. Koefisien negatif terhadap efisiensi teknis sesuai kajian Mengui et al., (2019); Panpluem et al., (2019) yang mengatakan bahwa variabel jenis kelamin koefisien negatif meskipun signifikan secara statistik terhadap efisiensi teknis berarti rumah tangga yang dikepalai perempuan memiliki peluang lebih besar untuk meningkatkan efisiensi.

### Pengaruh Pendidikan terhadap Efisiensi Teknis Kelapa Sawit Rakyat

Variabel pendidikan berpengaruh positif dan signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi CRS dan VRS yang dapat dilihat dari nilai koefisien sebesar 0,0039075; 0,0055012 yang menunjukkan bahwa 1% peningkatan pendidikan akan meningkatkan efisiensi sebesar 0,0039075%; 0,0055012%. Koefisien positif pendidikan terhadap efisiensi teknis sesuai kajian Arifin et al., (2021) yang mengatakan bahwa petani yang memiliki tingkat pendidikan yang lebih tinggi memiliki jaringan yang lebih luas sehingga akses informasi yang diperoleh bisa lebih luas dan lebih cepat dibandingkan dengan petani yang memiliki tingkat pendidikan yang lebih rendah. Variabel pendidikan berpengaruh negatif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi SE yang dapat dilihat dari nilai koefisien sebesar -0,000178 yang menunjukkan bahwa 1% peningkatan pendidikan akan menurunkan efisiensi sebesar -0,000178%. Koefisien negatif pendidikan terhadap efisiensi teknis sesuai kajian Artamevia et al., (2023); Putri et al., (2023) yang mengatakan bahwa semakin rendah tingkat pendidikan formal yang ditempuh petani, maka ada kecenderungan usahatani yang dijalankan semakin inefisiensi.

## **Pengaruh Jumlah Anggota Keluarga terhadap Efisiensi Teknis Kelapa Sawit Rakyat**

Variabel jumlah anggota keluarga berpengaruh negatif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi CRS, VRS dan SE yang dapat dilihat dari nilai koefisien sebesar -0,002656; -0,001305; -0,001212 yang menunjukkan bahwa setiap peningkatan 1 jiwa anggota keluarga akan menurunkan efisiensi sebesar -0,002656%; -0,001305%; -0,001212%. Koefisien negatif jumlah anggota keluarga terhadap efisiensi teknis sesuai kajian Adhiana *et al.*, (2022) yang mengatakan bahwa meningkatnya jumlah tanggungan maka petani menggunakan setengah modalnya untuk biaya kebutuhan hidup dari kegiatan usahatannya.

## **Pengaruh Pengalaman Bertani terhadap Efisiensi Teknis Kelapa Sawit Rakyat**

Variabel pengalaman bertani berpengaruh positif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi CRS dan VRS yang dapat dilihat dari nilai koefisien sebesar 0,0006493; 0,0002512. Variabel pengalaman bertani berpengaruh positif dan signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi SE yang dapat dilihat dari nilai koefisien sebesar 0,000363 yang menunjukkan bahwa setiap peningkatan 1 tahun pengalaman bertani akan meningkatkan efisiensi sebesar 0,0006493%; 0,0002512%; 0,000363%. Koefisien positif pengalaman bertani terhadap efisiensi teknis sesuai kajian Lutfi & Baladina, (2018) yang mengatakan bahwa pengalaman petani dalam berusahatani dapat meningkatkan kemampuan manajerial usahatannya, sehingga semakin efisien pula petani dalam menggunakan input produksi.

## **Pengaruh Jarak ke PKS terhadap Efisiensi Teknis Kelapa Sawit Rakyat**

Variabel jarak ke PKS berpengaruh positif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi CRS, VRS, dan SE yang dapat dilihat dari nilai koefisien sebesar 0,0003928; 0,0001137; 0,0003891 yang menunjukkan bahwa setiap peningkatan 1 km peningkatan jarak ke PKS akan meningkatkan efisiensi sebesar 0,0003928%; 0,0001137%; 0,0003891%. Koefisien positif jarak ke PKS terhadap efisiensi teknis tidak sesuai kajian kajian Thomas *et al.*, (2020) yang mengatakan bahwa semakin jauh jarak perkebunan dengan PKS harga jual tandan buah segar kelapa sawit juga semakin murah. Harga murah yang diterima oleh petani mengakibatkan kekurangan modal untuk produksi usahatannya.

## **Pengaruh Akses Kredit terhadap Efisiensi Teknis Kelapa Sawit Rakyat**

Variabel akses kredit berpengaruh positif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi CRS, VRS, dan SE yang dapat dilihat dari nilai koefisien sebesar 0,0162912; 0,0160525; 0,0040061 yang menunjukkan bahwa setiap 1% peningkatan sampel petani yang memperoleh akses kredit akan meningkatkan efisiensi sebesar 0,0162912%; 0,0160525%; 0,0040061%. Koefisien positif akses kredit terhadap efisiensi teknis sesuai dengan kajian Aung & Lee, (2021) yang mengatakan bahwa dengan adanya akses kredit maka akan memberikan petani modal

tambahan untuk membeli input, menerapkan teknologi modern, dan memperluas lahan pertanian mereka.

### **Pengaruh Aplikasi Pupuk Organik terhadap Efisiensi Teknis Kelapa Sawit Rakyat**

Variabel aplikasi pupuk organik berpengaruh positif dan signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi CRS dan VRS yang dapat dilihat dari nilai koefisien sebesar 0,0544762; 0,0642578. Variabel aplikasi pupuk organik berpengaruh positif dan tidak signifikan terhadap efisiensi teknis kelapa sawit rakyat berdasarkan asumsi SE yang dapat dilihat dari nilai koefisien sebesar 0,0071725 yang menunjukkan bahwa 1% peningkatan sampel petani yang menggunakan pupuk organik akan meningkatkan efisiensi sebesar 0,0544762%; 0,0642578%; 0,0071725%. Koefisien positif aplikasi pupuk organik terhadap efisiensi teknis sesuai kajian Putra *et al.*, (2021) yang mengatakan bahwa petani yang menggunakan pupuk organik dapat meningkatkan produksi dan efisiensi karena penggunaan pupuk organik bisa mengurangi kebutuhan pupuk anorganik dan berdampak pada kesuburan tanah melalui penerapan pemupukan yang seimbang dan mempertahankan hasil panen kelapa sawit.

### **Kesimpulan**

Dari hasil penelitian dan pembahasan yang telah dibahas dalam bab sebelumnya, maka dapat ditarik kesimpulan bahwa nilai efisiensi teknis perkebunan kelapa sawit rakyat di Kecamatan Bandar Pasir Mandoge berdasarkan asumsi CRS sebesar 0,929. Nilai ini berarti petani kelapa sawit di Kecamatan Bandar Pasir Mandoge yang tidak efisien harus mengurangi penggunaan input sebesar 7,1% supaya perkebunan kelapa sawit rakyat yang tidak efisien menjadi efisien berdasarkan asumsi CRS. Nilai efisiensi teknis berdasarkan asumsi VRS sebesar 0,941. Nilai ini berarti petani kelapa sawit di Kecamatan Bandar Pasir Mandoge yang tidak efisien harus mengurangi penggunaan input sebesar 5,9% supaya perkebunan kelapa sawit rakyat yang tidak efisien menjadi efisien berdasarkan asumsi VRS. Nilai efisiensi teknis berdasarkan asumsi SE sebesar 0,987. Nilai ini berarti petani kelapa sawit di Kecamatan Bandar Pasir Mandoge yang tidak efisien harus mengurangi penggunaan input sebesar 1,3% supaya perkebunan kelapa sawit rakyat yang tidak efisien menjadi efisien. Petani kelapa sawit di Kecamatan Bandar Pasir Mandoge dominan berada pada skala produksi IRS. Berdasarkan skala produksi ini, maka petani kelapa sawit harus meningkatkan skala usahatani supaya produksi kelapa sawit efisien.

Faktor-faktor sosial ekonomi yang mempengaruhi secara signifikan efisiensi teknis perkebunan kelapa sawit rakyat di Kecamatan Bandar Pasir Mandoge adalah pendidikan, pengalaman bertani dan aplikasi pupuk organik. Faktor-faktor sosial ekonomi yang mempengaruhi secara tidak signifikan efisiensi teknis perkebunan kelapa sawit rakyat di Kecamatan Bandar Pasir Mandoge adalah jenis kelamin, jumlah anggota keluarga, jarak ke PKS, dan akses kredit.

Hasil penelitian ini memberikan beberapa peluang untuk implikasi kebijakan. Pertama, hasil studi ini menegaskan adanya inefisiensi dalam produksi kelapa sawit rakyat di Kecamatan Bandar Pasir Mandoge, yang seharusnya disadari oleh para

petani. Meningkatkan kesadaran akan inefisiensi pengelolaan pertanian merupakan syarat wajib untuk meningkatkan produktivitas. Jika produsen kelapa sawit rakyat menyadari betapa inefisiennya mereka dalam mengelola sumber daya, mereka dapat secara sadar dan efektif menggabungkan input untuk mengoptimalkan output mereka. Kedua, hasil penelitian ini menyerukan disarankan pemerintah harus mengadakan program penyuluhan dan pelatihan secara teratur tentang manfaat dan cara penggunaan pupuk organik kepada petani kelapa sawit. Hal ini akan membantu meningkatkan pemahaman petani tentang keunggulan pupuk organik dan cara yang tepat untuk mengaplikasikannya, sehingga dapat meningkatkan produksi kelapa sawit dan efisiensi teknis. Ketiga, disarankan agar pemerintah senantiasa menyediakan fasilitas pendidikan, akses yang memadai guna meningkatkan pengetahuan petani tentang inovasi metode pertanian dan pemerintah perlu menyelenggarakan program pelatihan dan penyuluhan secara rutin bagi petani kelapa sawit, sehingga petani dapat meningkatkan produksi kelapa sawit dan efisiensi teknis. Keempat, terhadap petani yang berpengalaman pemerintah dapat mendukung petani kelapa sawit dengan melakukan penyuluhan penerapan pupuk kimia dan organik yang seimbang, sehingga petani dapat meningkatkan produksi kelapa sawit dan efisiensi teknis.

**Abstract.** *Simatupang J, Siregar MA, Sibuea MB. 2025. Gender-based technical efficiency analysis of smallholder palm oil plantations in North Sumatra, Indonesia. Asian J Agric 9: 766-776.* The productivity of smallholder palm oil plantations, managed by both male and female farmers, has recently been low due to inefficient allocation of inputs. Previous efficiency literature in Indonesia has not focused on examining differences in technical efficiency between the two genders of smallholder household heads and has used parametric methods. This study examines which oil palm farming is more efficient based on gender and the determinants of technical efficiency of smallholder farmers in North Sumatra, Indonesia. North Sumatra is a key region for palm oil production in Indonesia, and understanding the efficiency of smallholder farmers in this region can provide valuable insights for the entire industry. Input-output and socio-economic data on palm oil production activities in 2023 were collected from 273 male smallholders and 177 female smallholders. We employed Data Envelopment Analysis (DEA) to assess technical efficiency. We employed the Tobit model to examine the influence of socio-economic factors on the technical efficiency of smallholder farmers in the study area. We found that female smallholders are more efficient than male smallholders. However, inefficient female smallholders must reduce inputs to make their farming efficient. This study highlights the crucial role of access to credit, ICT, and farmer groups in technical efficiency. Government policies are expected to lower interest rates, simplify credit application requirements, develop extensive ICT infrastructure in smallholder plantations, and assist with access to capital and information dissemination within farmer groups. Government intervention is expected to improve the technical efficiency and economic sustainability of smallholder oil palm plantations in North Sumatra.

**Keywords:** DEA, efficiency, gender, palm oil, smallholder

## INTRODUCTION

Oil palm cultivation in North Sumatra, Indonesia, is carried out by three economic actors: state-owned enterprises, private companies, and smallholder oil palm plantations, with the region contributing 10.68% of total national production. Smallholder farmers play a significant role in oil palm production, contributing 34.52% of total output and achieving a productivity level of 3.55 tons per hectare (Direktorat Jenderal Perkebunan 2024). Smallholder oil palm productivity ranks lowest when compared to the other two participants.

Low productivity indicates that smallholder farmers are unable to efficiently produce oil palm, specifically in allocating inputs. Technical efficiency pertains to the ability of agriculture to effectively leverage current technology, aiming to achieve the highest possible output using a given set of inputs, or to minimize input usage while still attaining a designated output level (Minviel and Latruffe 2017). Technical efficiency is influenced by farmer characteristics, such as age, experience, education, and gender of the household head of the family (Mishra et al. 2017; Alem et al. 2018).

Gender encompasses the social roles and identities that individuals adopt, while gender roles serve as the main

factors influencing how responsibilities and resources are allocated between men and women (Quisumbing and Doss 2021). Women are acknowledged as an essential asset in the agricultural and rural economies of developing countries (Mishra et al. 2017). When women have access to resources, knowledge, and opportunities in agriculture in developing countries, they are better able to adopt sustainable practices and contribute to increased crop yields, improved food security, increased resilience to climate change, and enhanced biodiversity (Parawansa et al. 2025). However, existing social barriers in agriculture result in underappreciation of women's roles in food production and the rural economy (Quisumbing et al. 2014; Mishra et al. 2017). For instance, women as heads of families, when their husbands migrate out of town or have a widow status, do not have the right to vote to protest when the distribution of palm oil dividends is not transparent, and plasma land ownership is lower than that promised by palm oil companies in Indonesia (Elmhirst et al. 2017; Mawardati et al. 2022).

The issue of social discrimination between men and women as agricultural managers has sparked the interest of agricultural scholars. This study delves into the differences in agricultural efficiency between the two genders, highlighting the need for further investigation. Several

previous studies have found that male smallholder oil palm farmers are more efficient than their female counterparts (Koledoye and Deji 2015; Houngue and Nonvide 2020; Obi and Ayodeji 2020; Okorie et al. 2020; Olutumise et al. 2023). The inefficiency of female oil palm farmers is attributed to their limited access to critical resources, such as information, training, and technology. However, other studies have found that female smallholder farmers are more efficient than male ones (Dolisca and Jolly 2008; Effendy et al. 2019). Women outperform their competitors because female farm managers have easier access to new cultivation techniques, credit, and pest management. Furthermore, previous studies found no difference in efficiency between the two genders of household heads, underscoring the need for further research in this area (Missiame et al. 2021; Neupane et al. 2022).

Previous efficiency literature in Indonesia (Alwarritzi et al. 2015; Ariyanto et al. 2020; Abdul et al. 2022; Dalheimer et al. 2022) has not analyzed the differences in technical efficiency between the two genders of smallholder household heads using a non-parametric DEA approach. Many agricultural scholars use non-parametric DEA to address weaknesses in parametric methods, such as overly restrictive assumptions about the relationship between inputs and outputs (Anang et al. 2020). This study focuses on examining the efficiency of oil palm smallholders based on the gender of the household head to add to the existing efficiency literature in Indonesia. This study seeks to assess the technical efficiency of smallholder oil palm farmers, taking into account the gender of the head of the household through Data Envelopment Analysis (DEA), while also investigating the factors that influence technical efficiency using Tobit regression analysis. Achieving high technical efficiency in smallholder oil palm plantations in North Sumatra can support SDG 5 on

achieving gender equality and SDG 12 on ensuring sustainable consumption and production patterns.

## MATERIALS AND METHODS

### Research area and sampling method

North Sumatra Province has the third most significant area of oil palm plantations in Indonesia and the fifth most significant area of smallholder oil palm plantations in Indonesia. In 2023, the area of oil palm plantations in North Sumatra Province consisted of 35.60% smallholder plantations, 21.98% state-owned plantations, and 42.42% private companies (Direktorat Jenderal Perkebunan 2024).

A multi-phase sampling methodology was used to identify smallholder oil palm farmers in North Sumatra. We selected research locations based on the zoning of North Sumatra: the East Coast, Highlands, and West Coast. Asahan District represented the East Coast, Simalungun District represented the Highlands, and Padang Lawas District represented the West Coast. The selected regencies were determined by the highest levels of palm oil production from smallholder plantations in each region. The next stage involved selecting sub-districts based on the most significant palm oil production from smallholder plantations in each district. We selected Bandar Pulau Sub-district for Asahan District, Hatonduhan Sub-district for Simalungun District, and Lubuk Barumun Sub-district for Padang Lawas District. The next stage was the selection of villages based on statistical information on smallholder oil palm plantations in each district. This study selected Gonting Malaha and Padang Pulau Villages for Bandar Pulau Sub-district, Buntu Bayu and Buntu Turunan Villages for Hatonduhan Sub-district, and Aek Lancat and Pagaran Mompang Villages for Lubuk Barumun Sub-district (Figure 1).

**Figure 1.** Location of the study  
UNIVERSITAS MEDAN AREA

There are 63,840 smallholder oil palm farmers in the three sub-districts. Using the Slovin method with a 5 percent margin of error, the minimum sample size was 398 farmers. Since no data is available on smallholder oil palm farmers in each village, we used simple random sampling to select smallholder farmers as research samples with the same number of samples in each village. Thus, the total sample was 75 smallholder farmers for each village, and the total research sample was 450 smallholder farmers.

This study focuses on comparing the efficiency of oil palm small-scale farmers by gender. The total sample comprised 273 male smallholder farmers and 177 female farmers. The selection of female farmer samples was based on their widowed status because their husbands had died or because they were divorced. The distribution of smallholder farmers' samples based on the gender of the head of the family is presented in Table 1.

**DEA model**

Koopmans (1951) characterized technical efficiency for a producer as the situation in which enhancing output necessitates either a reduction in at least one additional output or an augmentation in at least one of the inputs. On the other hand, a decrease in input requires a corresponding reduction in at least one additional input or a decrease in at least one output. Efficiency assessments yield two critical insights: guidance for optimal resource allocation and strategies to minimise unnecessary inputs (Anang et al. 2020). Scholars employ a variety of methodologies to assess the technical efficiency of smallholders, which can generally be classified into two main categories: parametric and non-parametric methods (Wang and Hu 2021). The data envelopment analysis model was chosen for this research because it does not require prior assumptions about the relationship between inputs and outputs, operates independently of a model that identifies sources of inefficiency, and effectively handles multiple outputs (Anang et al. 2020).

The DEA model is divided into two categories: input-oriented and output-oriented models, depending on the orientation employed. The input-oriented DEA model emphasizes the minimization of inputs while maintaining a specified level of output. The output-oriented DEA model emphasizes the goal of maximizing the proportional enhancement in output generated from a specified set of inputs (Coelli et al. 2005). The input-oriented DEA model is more appropriate for this study because smallholder oil palm farmers can only control inputs. In other words, they

cannot increase output due to technological limitations and land suitability (Toma et al. 2015). The DEA model is classified into two distinct types according to specific assumptions: CCR-DEA is based on the premise of constant returns to scale, while BCC-DEA is grounded in the concept of variable returns to scale (Nguyen et al. 2020). The DEA CRS model is applicable when a consistent relationship exists at scale between the output and input of the analyzed decision-making unit. The DEA VRS model is suitable for decision-making units that cannot be uniformly assessed alongside all units within a particular sector (Piran et al. 2020). The separation of technical efficiency and scale efficiency to capture the actual managerial expertise of smallholder farmers is the reason we used the VRS assumption DEA model (Perrigot and Barros 2008).

In this context,  $\theta_k$  represents the Technical Efficiency (TE) value for the  $k$ th smallholder plantation, which varies between 0 and 1. The variable  $y_j$  denotes the vector of fresh fruit bunch outputs from oil palm, while  $x_i$  indicates the vector of input quantities, including land, fertilizer, pesticide, and labor. Additionally,  $\lambda$  refers to the weighting vector. The VRS constraint is expressed as  $\sum_{k=1}^m \lambda_k = 1$ . As a result, the formulation for DEA input orientation, along with the assumptions of VRS for evaluating the technical efficiency of oil palm smallholder plantations, can be articulated as follows (Piran et al. 2020):

$$\begin{aligned} & \min \theta_k \\ & \text{Subject to} \\ & -y_j + y_{jk} \lambda_{jk} \geq 0; \forall j = 1 \\ & \theta_k x_i - x_{ik} \lambda_k \geq 0; \forall i = 1, \dots, 4 \\ & \sum_{k=1}^m \lambda_k = 1; \forall k = 1, \dots, m \\ & \lambda \geq 0 \end{aligned} \tag{1}$$

Where:

- $\theta_k$  : Technical Efficiency (TE) value for the  $k$ th smallholder plantation
- $y_j$  : Fresh fruit bunch (kg FFB)
- $x_1$  : Land (ha)
- $x_2$  : Labor (man-days)
- $x_3$  : Fertilizer (kg)
- $x_4$  : Pesticide (litre)
- $\forall_k$  : Number of samples, where the sample of male farmers is 1,..., 273 and female farmers is 1,..., 177, and the pooled sample is 1,..., 450

**Table 1.** Sample distribution by gender and research location

| Regions/District        | Sub-district  | Village         | Sample size |        |       |
|-------------------------|---------------|-----------------|-------------|--------|-------|
|                         |               |                 | Male        | Female | Total |
| East Coast/Asahan       | Bandar Pulau  | Gonting Malaha  | 47          | 28     | 75    |
|                         |               | Padang Pulau    | 47          | 28     | 75    |
| Highlands/Simalungun    | Hatonduhan    | Buntu Bayu      | 47          | 28     | 75    |
|                         |               | Buntu Turunan   | 46          | 29     | 75    |
| West Coast/Padang Lawas | Lubuk Barumun | Aek Lancat      | 40          | 35     | 75    |
|                         |               | Pagaran Mompang | 46          | 29     | 75    |
| Total                   |               |                 | 273         | 177    | 450   |

Source: Pre survey data

The assessment of Equation (1) relates to the technical efficiency of the  $j$ th small farmers' oil palm, in comparison to all other smallholder plantations within the sample set. We also measure the return to scale of each smallholder oil palm plantation in the sample through scale yield performance ( $\lambda$ ). When the sum of the calculated weights ( $\lambda$ ) of the reference DMUs (benchmark) surpasses one, there will be an increase in returns to scale. If it is below one, the scale returns will decrease. In the context of CRS, the computed weighted sum ( $\lambda$ ) for the reference (benchmark) DMU is precisely one (Piran et al. 2020). This study assumes that there are similarities in the use of oil palm cultivation technology in the three regional zones in North Sumatra. Additionally, we examine the technical efficiency of oil palm small farmers by analyzing the gender of the family head through an independent sample test. This study uses MaxDea 12 software to examine technical efficiency with the input-oriented VRS assumption DEA model.

### Tobit analysis

This investigation, after to the efficiency calculation via DEA, aims to uncover the elements influencing the efficiency of small farmers' oil palm. The analysis will concentrate on agricultural factors linked to technology and socio-economic traits, such as the gender of the household head. In empirical studies focused on efficiency, the efficiency value ranges from 0 to 1, which restricts the observation of independent variables to a limited extent. Standard regression models, like the Ordinary Least Squares (OLS) model, prove inadequate for these analyses due to the left and right censoring of the dependent variable, which leads to inconsistent parameter estimates (Cecchini et al. 2021). The Tobit model adeptly tackles this issue, and many academics employ this model for empirical studies on efficiency factors. The Tobit model, often referred to as the restricted dependent variable model, employs maximum likelihood estimation to perform regression analysis on the dependent variable, aiming to identify the factors influencing the efficiency of smallholder oil palm farmers (Zhou et al. 2022).

In this context,  $\theta_k$  represents a hidden dependent variable that is measured within the range of 0 to 1, specifically indicating the efficiency score of oil palm smallholder plantations, while being censored outside this interval. The term  $\alpha$  represents the unknown intercept, and  $\varepsilon_k$  follows an independent and identically distributed normal distribution with a mean of 0 and a variance  $\sigma^2$ . The vector  $Z_n$  encompasses the covariates, while  $\beta$  signifies a vector of parameters that require estimation, aimed at quantifying the linear influence of socio-economic explanatory variables on the efficiency score of oil palm smallholder plantations. The entire sample is analyzed using Equations (2) and (3). Consequently, the assessment of elements influencing the technical efficiency of male smallholder farmers ( $\theta_{km}$ ) and the elements affecting the technical efficiency of female smallholder plantations ( $\theta_{kf}$ ) can be articulated in the following manner:

$$\theta_{km} = \alpha + Z_n\beta + \varepsilon_m; \forall n = 1, 2, \dots, 12 \quad [2]$$

$$\theta_{kf} = \alpha + Z_n\beta + \varepsilon_f; \forall n = 1, 2, \dots, 12 \quad [3]$$

Where:

$\theta_{km}$  : Technical efficiency of male smallholder farmers

$\theta_{kf}$  : Technical efficiency of female smallholder farmers

$\beta$  : Socio-economic parameters

$Z_1$  : Age

$Z_2$  : Education

$Z_3$  : Farming experience

$Z_4$  : Household size

$Z_5$  : Seedling category

$Z_6$  : Trees

$Z_7$  : Credit

$Z_8$  : Distance to market

$Z_9$  : Organic fertilizer

$Z_{10}$  : Farmer groups

$Z_{11}$  : ICT

$Z_{12}$  : Genders

The censored variable  $\theta_j$ , which reflects the efficiency score of oil palm smallholder plantations derived from equation (4), can be articulated as follows.

$$\theta_k = \begin{cases} \theta_k & \text{if } 0 < \theta_k < 1 \\ 1 & \text{if } \theta_k \geq 1 \\ 0 & \text{if } \theta_k \leq 0 \end{cases} \quad [4]$$

Before performing the estimation, a correlation analysis is carried out between the DEA input/output and regressors to reduce bias in the Tobit estimation (Coelli et al. 2005). Multicollinearity tests are performed on independent variables through the use of VIF to improve model specifications, and the VIF score is recommended to be below 5 to avoid multicollinearity problems (Marcoulides and Raykov 2019). We use the Breusch Pagan/Cook Weisberg test to assess heteroscedasticity in the model, and p value above alpha indicates no heteroscedasticity (Aguade et al. 2022). Given that the Tobit parameters lack direct interpretability, marginal effects are employed for conducting post-estimation tests on the Tobit regression. Marginal effects tests are conducted to assess the impact on the observed mean value of  $\theta_j$  in relation to variations in  $Z_k$  (Wooldridge 2019). We used STATA 17 software to investigate the Tobit model before and after the estimation.

### Data and variables

This study uses primary data collected from smallholder oil palm farmers during production activities in 2023. Data were collected from February to May 2024 through questionnaire interviews with farmers at the designated study locations. The data collected included socio-economic attributes of smallholder oil palm farmers, as well as oil palm inputs and outputs.

Palm oil production (Y) was calculated based on last year's kilograms of fresh fruit bunches. Land (X1) is calculated based on the area of the oil palm plantation in hectares. Labor (X2) is calculated based on the involvement of male and female laborers, both family and wage workers. Fertilizer (X3) includes several chemical fertilizers: urea, NPK, KCL, SP36, ZA, dolomite, and organic fertilizers in kilograms. Pesticides (X4) include several chemical pesticides: Roundup, Gramoxone, and

Paratop, measured in liters. Input and output variables are used to measure technical efficiency.

The age measurement ( $Z_1$ ) is established based on the number of years of the household head. The evaluation of education ( $Z_2$ ) is characterized by the cumulative years of formal educational attainment of the family head. Farming experience ( $Z_3$ ) is obtained from the duration of smallholder farmers' involvement in oil palm cultivation. The measurement of household size ( $Z_4$ ) is determined by the count of individuals residing in the same dwelling. The seed category ( $Z_5$ ) is defined as a dummy variable, based on the classification of certified and uncertified seeds. We assign a label of 1 when a farmer uses seeds produced by a government-licensed institution, while uncertified seeds are assigned a label of 0. Trees ( $Z_6$ ) are measured based on the number of productive plants (3-25 years) per plot managed by smallholder farmers. Credit ( $Z_7$ ) as a dummy variable is determined based on small farmers who take loans from banks or other formal financial institutions being labeled 1, and not taking loans being labeled 0. Distance to market ( $Z_8$ ) is measured in kilometers based on the distance from home to the input market. Organic fertilizer ( $Z_9$ ) is measured based on the experience of smallholders farming using organic fertilizer for years. Farmer groups ( $Z_{10}$ ) are measured based on the smallholders' experience joining farmer groups over the years. ICT ( $Z_{11}$ ) is measured based on the experience of smallholder farmers using electronic gadgets to obtain information and communication on oil palm farming management in units of years. Gender ( $Z_{12}$ ) is a dummy variable, where male heads of household are labeled 1, while female heads of household are labeled 0. Table 2 shows a descriptive analysis of smallholder oil palm plantations.

## RESULTS AND DISCUSSION

### Characteristics of samples

The characteristics of the sample are presented in Table 3. In terms of input variables, the land owned by male smallholders is 26.58% larger compared to that of female smallholders. The labor and pesticides used by male smallholders are 15.75% and 25.88% more than those used by female smallholders. The three inputs differ significantly between the two groups of smallholder samples. Only the amount of fertilizer used by both groups of smallholder samples is considered the same. Regarding output variables, male smallholders' oil palm production is 21.58% greater than that of female smallholders.

Regarding socio-economic variables, the age of male smallholders is 4.29% younger than that of female smallholders. Male smallholders' number of oil palm plants is 26.48% greater than that of their competitors. Female smallholders have more experience in oil palm farming and use organic fertilizers by 18.29% and 141%, respectively, than male smallholders. The majority of female smallholders use more certified seeds than male smallholders. However, only 25% of female smallholders access credit, while 51% of male smallholders access credit. Female smallholders' land is 20.92% closer to the input market than their competitors. Finally, female smallholders have been members of farmer groups longer and use ICT by 74.92% and 18.02%, respectively, than their competitors.

### Efficiency of smallholder oil palm plantations

The findings of our study indicate that the average technical efficiency for both female and male smallholders was 0.882, as shown in Table 4. Based on the VRS assumption, female and male smallholders need to reduce input usage by 10.8% and 12.75%, respectively, to make their oil palm farming efficient. Additionally, our findings indicate that female smallholders demonstrated a higher level of efficiency compared to their male counterparts.

The efficiency score of female smallholders was 1.95% higher than that of their competitors. This value means that all smallholder oil palm farmers need to reduce input usage by 11.8% to make their oil palm farming efficient.

Figure 2 reveals that female samples are more efficient than male samples. The number of technically efficient female farmer samples is 18.64% and the number of efficient male farmer samples is 12.45%.

### Determinant of technical efficiency

This study examines the elements influencing the productivity of smallholder oil palm plantations, operating under the premise of variable returns to scale. Before undertaking a more detailed characterization of the Tobit model estimation, it is crucial to examine a concise overview of the post-estimation test results to evaluate possible model specifications. The VIF test indicated that multicollinearity was not present among the independent variables. Based on the model specification test in Table 5, the test produced mean values for the factor model estimates assessing the efficiency of female, male, and pooled smallholder farmers of 1.65, 2.09, and 1.82, respectively, with no variable exceeding a VIF of 5. We found that the Breusch Pagan/Cook Weisberg p-value for the three sample groups was above the alpha level, indicating no evidence of heteroscedasticity. The likelihood ratio test results of 253.7, 446.75, and 659.73 for the models assessing the factors influencing the efficiency of female, male, and pooled smallholder farmers, respectively, along with a p-value of 0.000 in all instances, indicate that our overall model is statistically significant when juxtaposed with the null hypothesis, which posits that all predictor coefficients are zero. The coefficient of Marginal Effect (ME) is utilized in the factor model that assesses efficiency, as it signifies the change in magnitude between the dependent and independent variables (Simatupang and Nababan 2023).

The age of the head of the household, educational background, and the number of trees show a positive and significant influence on the efficiency scores of male small farmers, as well as the overall sample. The ME coefficient values for the variables related to the age of the head of the household, level of education, and plants in the factor model evaluating the efficiency of male farmers are 0.0016, 0.0023, and 0.00003, respectively. The ME coefficient value of 0.0023 suggests that an extra year of formal education for male small farmers leads to a 0.0023% enhancement in their technical efficiency. Related to the distance to the market, the negative and significant impact

on the efficiency scores of male small farmers and the pooled sample. The ME coefficient value of -0.0287 indicates that an increase of one kilometer in distance from the house to the input market results in a decrease of 0.0287% in the technical efficiency of male small farmers.

This study revealed significant adverse effects of farming experience, family size, and seed category on the efficiency scores of female smallholders, male smallholders, and the combined sample of smallholder farmers. However, the substantial impact of farmer groups and ICT on the efficiency scores of female smallholders, male smallholders, and the overall sample of smallholder farmers offers hope for potential improvement. The ME coefficient of farmer groups is 0.0048 in the sample model of male and female farmers, indicating that one year of experience in farmer groups has the potential to increase their technical efficiency by 0.0048%. The ME coefficient of ICT in the three sample groups is 0.0245, 0.0236, and 0.0263, respectively. These values mean that one year of farmer experience using ICT has the potential to increase their technical efficiency by 0.0245%, 0.0236%, and 0.0263%. Notably, credit was found to have substantial effects on the efficiency score of female smallholder farmers. Lastly, the study found no significant effect of organic fertilizer on the three efficiency models examined.

### Discussion

The technical efficiency of female smallholders is higher than that of male smallholders. The statement can be proven that one hectare of land by female smallholders can produce 21.98 tons of palm oil, while the productivity of male smallholders' land is only 21.09 tons per hectare. When comparing the test on productivity for both samples, we found that female smallholders' land productivity is significantly higher than that of male smallholders. According to Koopmans (1951), technical efficiency occurs because of high productivity, which comes from the ability to manage minimum input to produce output.

**Table 5.** Determinants of technical efficiency

Source: Primary data analysis. \*, \*\* indicate significant levels at 90%

Based on in-depth field interviews, female smallholder farmers do not experience discrimination in accessing productive resources, such as land, fertilizer, labor, and oil palm cultivation training. Cover crops and cattle farming, which enhance land conservation, are frequently recommended during training sessions to ensure sustainable smallholder oil palm plantations. Local governments and farmer groups provide training. Female smallholder farmers focus on leveraging the knowledge gained from the training to increase oil palm productivity and meet their household needs. In contrast to male smallholders, they have businesses other than oil palm as additional sources of household income. The large amount of time spent on businesses other than oil palm causes male smallholders to be less focused on managing their farms. Thus, female smallholders are more efficient than male smallholders because they are more productive in using inputs than men. Our findings align with previous studies (Missiame et al. 2021; Obokare et al. 2024). Our analysis revealed that gender did not have a significant impact on the technical efficiency of smallholders within the pooled sample. This finding indicates that the gender of smallholders does not play a significant role in enhancing efficiency.

Socio-economic variables influence technical efficiency improvements across all three sample groups. Farmer age has the potential to enhance the technical efficiency of male smallholders, as well as in the combined samples. This situation illustrates that the technical efficiency of smallholder oil palm plantations managed by older male farmers and the combined sample is significantly greater than that of smallholder oil palm plantations managed by younger farmers. This result is possible because older smallholders have better abilities, skills, and experience in agricultural activities, which can trigger increased technical efficiency. Our findings align with those of Anang et al. (2016) and Tenaye (2020). Conversely, Baiyegunhi (2020) and Simatupang and Nababan (2023) and Ojo found that older smallholders are more efficient than younger ones, while Simatupang et al. (2025) found that the age of the household head did not significantly affect smallholder efficiency.

The results demonstrate that a higher educational attainment of the head of the household is correlated with improved technical efficiency. That finding means that small male farmers and pooled samples with high formal education tend to adopt and utilize oil palm management technology. This result is consistent with the results reported by Alwarritzi et al. (2015) and Abdul et al. (2022).

Our study highlights that smallholder farmers in all three sample groups with less experience are more efficient than those with more experience. This is probably because smallholder farmers with less experience (<18 years) possess extensive knowledge about oil palm and are more proactive in seeking new information to improve oil palm productivity and efficiency.

Large household sizes can potentially reduce the technical efficiency of smallholder farmers in the three sample groups. This finding indicates that smallholder farmers with large household sizes are directly linked to

increasing household expenditures and face challenges in accumulating capital to purchase oil palm inputs. A relatively significant decrease in input costs impacts the production and technical efficiency of smallholder oil palm farmers. This finding is in line with the findings of Ramezani et al. (2022). However, Mengui et al. (2019) revealed a positive relationship between household size and the technical efficiency of smallholder farmers.

Certified oil palm seeds are provided by companies holding certified seed licenses, while uncertified oil palm seeds are offered by unlicensed companies or individuals to smallholder farmers. The research findings indicate that uncertified seeds have the potential to improve the technical efficiency of smallholder farmers across three sample groups. This is possible because the seeds used by farmers are of good quality, even though they are not sourced from official (certified) institutions. They are likely better suited to the local conditions in the study area, including land and climate suitability. On the other hand, certified (high-quality) seeds require intensive management that may not be feasible for smallholder farmers. Farmers using uncertified seeds have a higher ability to minimize input use to achieve technically efficient input use levels than farmers using certified seeds. These results align with the conclusions drawn by Setiawan et al. (2023). However, research conducted by Abdul et al. (2022) indicates that certified seeds have a positive effect on the technical efficiency of oil palm plantations due to suitable climatic conditions.

We found that the more productive trees planted per hectare, the higher the efficiency of male smallholders and pooled samples. A density of 110-160 trees per hectare can effectively balance between the immediate canopy's closure during the young phase, the abundance of palm trees (i.e., bunches) in the developing adult phase, and the minimized competition for light among palm trees in the adult phase (Woittiez et al. 2017). If the average number of productive trees planted by male smallholders and pooled samples is 136 trees per hectare and 134 trees per hectare, respectively, then around 15% and 16.25% of productive trees can still be added by smallholders to increase their efficiency. Productive trees (high-yielding phase) range from 8 to 14 years after planting (Woittiez et al. 2017). This finding is consistent with the conclusions reached by Abdul et al. (2022).

We found that credit access is negatively related to the technical efficiency of female smallholder farmers. The findings indicate that female smallholder farmers lacking access to credit from formal financial institutions demonstrated greater efficiency compared to their counterparts who did access such credit. In-depth interviews with female smallholder farmers revealed that participants obtained funding from informal sources, including friends, relatives, input providers, and collectors. The sources offered reduced interest rates and processing fees, while requiring minimal collateral. The accessibility of informal sources facilitated their acquisition of input technology, which has the potential to enhance productivity and technical efficiency in oil palm farming. Tenaye (2020) highlights that smallholder farmers encounter numerous

challenges in obtaining credit, such as difficulties with timing and quantity of credit, guarantee demands, and terms of repayment. Haryanto et al. (2023) demonstrated that simplifying collateral requirements and reducing interest rates on loans from formal sources may enhance farmers' access to credit from formal financial institutions, thereby boosting agricultural efficiency and productivity.

This study found that the closer the distance to the input market, the higher the efficiency score of male smallholder farmers and pooled samples. The closer the distance from home to the market, the lower the transportation costs for purchasing inputs. Smallholder farmers can divert low transportation costs to purchase other input technologies, which aim to increase the production and efficiency of oil palm smallholder plantations. This finding is in line with the findings of Teferra et al. (2018).

Our findings indicate that smallholders with prolonged membership in farmer groups possess the capacity to enhance the technical efficiency of smallholders across all three sample groups. This finding means that smallholders who are members of farmer groups have the opportunity to increase their knowledge through information exchange and cooperation (such as making water channels), which they actively engage in, thereby increasing production and efficiency. This finding aligns with previous studies (Bairagi and Mottaleb 2021; Olagunju et al. 2021), which found that smallholder farmers in farmer groups have access to agricultural information, credit, and inputs, which in turn improves their technical efficiency.

This study found that seasoned farmers leveraging ICT can enhance the technical efficiency of smallholder farmers across all three sample groups. This finding indicates that smallholder farmers who actively seek new information and communicate with farmer groups, academics, and the government through electronic devices can more easily increase their knowledge and improve the technical efficiency of oil palm smallholder farming. The results align with earlier research (Mwalupaso et al. 2019; Kang et al. 2023), indicating that smallholder farmers consistently engaged in the use of ICT, as well as mobile phones, can

enhance their technical efficiency. This study can be summarized in the conceptual diagram in Figure 3.

In conclusion, this study contributes to the literature on oil palm smallholders in North Sumatra by analyzing differences in technical efficiency across gender groups and identifying determinants affecting efficiency among male, female, and pooled farmers. The results show that female smallholders are more technically efficient because they use inputs more effectively to achieve high productivity, despite being older, having larger households, and generally having lower education levels. Strengthening government policy support is essential to enhance the efficiency of female smallholders. Interventions such as lower interest rates, easier access to credit (KUR), support for replanting programs, ICT infrastructure in rural areas, and farmer-group training can improve capital access and input use, thereby increasing productivity, efficiency, and household income. In the long term, these policies can promote economic sustainability and support biodiversity in small-scale plantations. Limitations include the omission of input prices and farmer welfare; future studies should integrate these variables and environmental efficiency.

## ACKNOWLEDGEMENTS

The author expresses sincere appreciation to the Sub-district Heads of Bandar Pulau (Asahan), Hantonduhan (Simalungun), and Barumon (Padang Lawas), Indonesia, for their support during the study. Gratitude is extended to Zulkarnain Lubis, Head of the Doctoral Program in Agricultural Sciences at Universitas Medan Area, North Sumatra, Indonesia, for his guidance, as well as to the Rector of the Universitas Methodist Indonesia and the Indonesian Methodist Church Education Foundation Region I for financial assistance. Special thanks are given to Manaor B.P. Nababan and Aditia E.C. Simatupang for their help in data collection and processing. This paper forms part of the requirements for the Doctoral Program in Agricultural Sciences, Postgraduate Program, Universitas Medan Area, North Sumatra.
